Plaashek

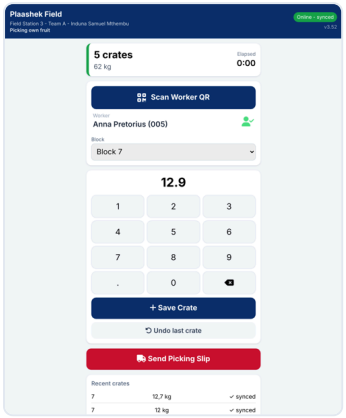

Farm software, one module per job, one farm per database. Hosted in South Africa at **yourfarm.plaashek.co.za**.

Built on a working farm for any crop that workers pick by hand: litchis, mangoes, avocados, citrus, macadamias, table grapes, stone fruit, berries. **Apple or Android** phones and tablets, nothing from an app store, and every field screen works with no signal.

Scan badge → Weigh crate → Send slip → Receive at the gate → Treat and pack → Pallet stack → Delivery note and export papers → Truck while Labour clocks the pack house and Owner watches it all

Harvest

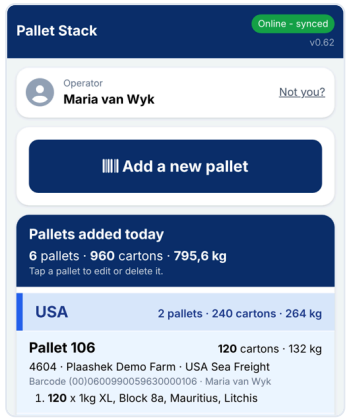

Field tablets, the gate, the office

- Badge scan, crate weight, picking slip
- Receiving: expected vs actual, condition
- Dashboard, picker pay per kg, reports
- Week planner, master data, badges

Packhouse

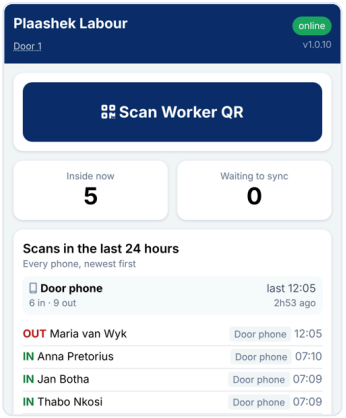

Tablets on the floor, phones at dispatch

- Sulfur tent and acid bath timers with alarms
- Pallet Stack: scan the label, list the cartons
- Delivery notes, USA and EU export forms
- Juice bins; any other process added as a screen

Labour

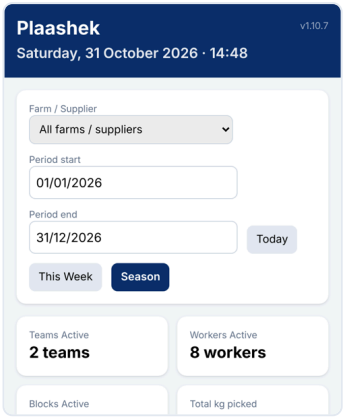

A phone at the pack-house door

- Same badge: green IN, red OUT
- Hours, daily and weekly overtime at the farm's rate
- Fix: every unpaired scan before payday
- Wage sheet to Excel

Owner

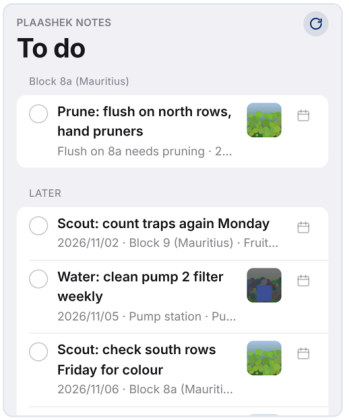

The owner's phone

- This season against every season
- Crop estimate block by block, in versions
- Weather record and a transparent risk score
- Market prices by pack type and buyer

Notes

The owner, the foreman, the next generation

- Dictate a note where you stand, with block and weather
- Actions become work orders on the To do list
- A block's whole history, searchable
- Optional AI tidy-up and questions

One register, entered once

Workers, badges, blocks and suppliers live in Harvest; Packhouse, Labour and Owner read them. Owner reads the harvest and delivery notes; the planner reads the owner's estimate back. Nothing is typed twice.

Offline first

Crates, scans, runs, pallets and notes are saved on the device the instant they are captured and synced when there is signal. A double tap or a re-send never makes a duplicate.

Hosted in South Africa

Each farm has its own address and its own database, encrypted in transit and at rest, backed up daily, never shared between farms. Nothing to install or look after on a farm PC.

Start with one module

Take Harvest alone, or Notes alone, and add the others as the farm needs them. Any phone works in the field; we recommend the rugged Ulefone RugKing 3 Pro or 4 Pro at the picking stations.

Plaashek · the suite at a glance. Each module has its own overview document.

All screens show demonstration data.
