All screens show demonstration data

Plaashek

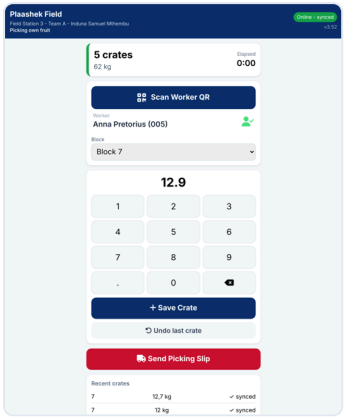

Farm software, one module per job, one farm per database. Hosted in South Africa at **yourfarm.plaashek.co.za**.

Built on a working farm for any crop that workers pick by hand: litchis, mangoes, avocados, citrus, macadamias, table grapes, stone fruit, berries. **Apple or Android** phones and tablets, nothing from an app store, and every field screen works with no signal.

Scan badge → Weigh crate → Send slip → Receive at the gate → Treat and pack → Pallet stack → Delivery note and export papers → Truck while Labour clocks the pack house and Owner watches it all

Harvest

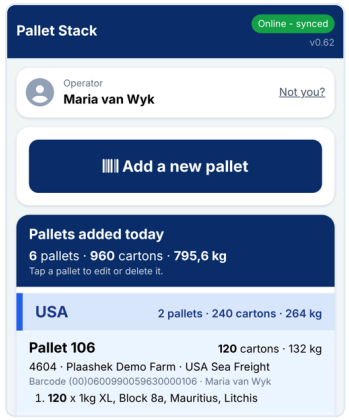

Field tablets, the gate, the office

- Badge scan, crate weight, picking slip
- Receiving: expected vs actual, condition
- Dashboard, picker pay per kg, reports
- Week planner, master data, badges

Packhouse

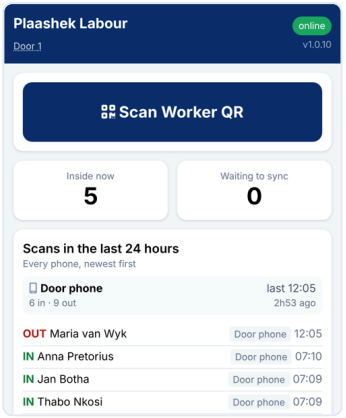

Tablets on the floor, phones at dispatch

- Sulfur tent and acid bath timers with alarms
- Pallet Stack: scan the label, list the cartons
- Delivery notes, USA and EU export forms
- Juice bins; any other process added as a screen

Labour

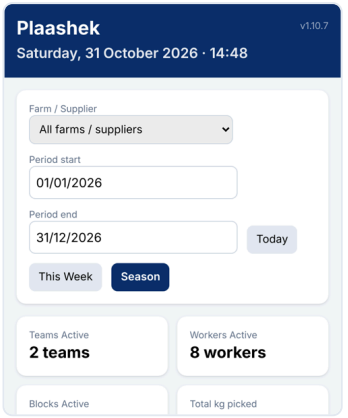

A phone at the pack-house door

- Same badge: green IN, red OUT
- Hours, daily and weekly overtime at the farm's rate
- Fix: every unpaired scan before payday
- Wage sheet to Excel

Owner

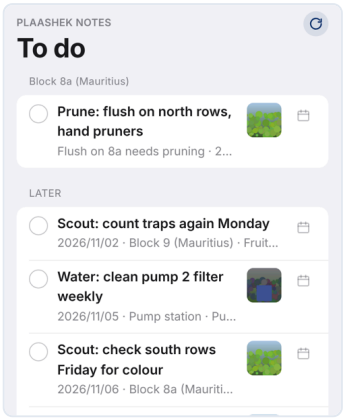

The owner's phone

- This season against every season
- Crop estimate block by block, in versions
- Weather record and a transparent risk score
- Market prices by pack type and buyer

Notes

The owner, the foreman, the next generation

- Dictate a note where you stand, with block and weather
- Actions become work orders on the To do list
- A block's whole history, searchable
- Optional AI tidy-up and questions

One register, entered once

Workers, badges, blocks and suppliers live in Harvest; Packhouse, Labour and Owner read them. Owner reads the harvest and delivery notes; the planner reads the owner's estimate back. Nothing is typed twice.

Offline first

Crates, scans, runs, pallets and notes are saved on the device the instant they are captured and synced when there is signal. A double tap or a re-send never makes a duplicate.

Hosted in South Africa

Each farm has its own address and its own database, encrypted in transit and at rest, backed up daily, never shared between farms. Nothing to install or look after on a farm PC.

Start with one module

Take Harvest alone, or Notes alone, and add the others as the farm needs them. Any phone works in the field; we recommend the rugged Ulefone RugKing 3 Pro or 4 Pro at the picking stations.

Plaashek · the suite at a glance. Each module has its own overview document.

All screens show demonstration data.

Contents

The suite at a glance
One page: the fruit's path, the five farm modules, and how they fit 2

1 **Harvest**
Field capture, receiving, dashboard, picker pay, reports, planner, master data 4

Each module section opens with its own cover and can be read on its own. All screens show demonstration data on a fictitious farm. Plaashek · WhatsApp 083 456 5646 · info@plaashek.co.za · www.plaashek.co.za

PRODUCT OVERVIEW

Plaashek

Harvest: field capture, receiving and picker pay

Every crate picked, weighed and paid for. Plaashek Harvest runs the picking season from the orchard to the pack-house gate to the wage sheet, on devices that keep working where there is no signal. It works for any crop that workers pick by hand: litchis, mangoes, avocados, citrus, macadamias, table grapes, stone fruit, apples and pears, berries, tomatoes and peppers.

Field
Tablets at the picking stations: scan the worker's badge, type the crate weight, send the load.

Pack house
The gate screen: every load on its way, oldest first, checked in with a count and a condition.

Admin
The office: live dashboard, wage runs, reports, the week's harvest plan and the master data.

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; names, blocks and figures are invented.

HOW IT FITS TOGETHER

One system, three screens

Each device is set up once with its role and then only ever shows that role's screen. The office signs in with its own login; field and pack-house tablets are paired to the farm once and need no password after that.

Field

Crate capture at the picking station. Works fully offline and syncs the moment the tablet sees the server again.

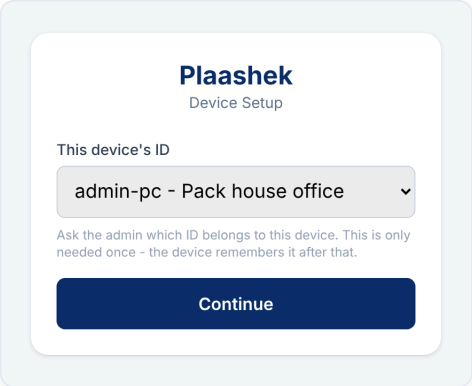

Pack house

Receiving at the gate. Shows what is in transit and how long it has been on the road, and records what actually arrived.

Admin

The office. Dashboard, payments, reports, planner and settings, on a PC or a phone.

Scan badge → Weigh crate → Send picking slip → Receive at the gate → Dashboard & reports → Wage sheet

Device setup. Pick this device's station once; it remembers it.

Built for a working farm

- **Any hand-picked crop.** Litchis, mangoes, avocados, citrus, macadamias, table grapes, stone fruit, pome fruit, berries or vegetables: if workers fill crates, bags or lugs and are paid by weight or count, Plaashek fits. Blocks, varieties and the pay rate are the farm's own.
- **Offline first.** A crate is saved on the tablet the instant it is captured. No signal in the orchard changes nothing.
- **Badge scan, not a dropdown.** Workers are identified by the QR code on their printed badge, so a crate can never land on the wrong name.
- **Colour tells the time.** Loads turn from green to amber to red the longer they wait, in the field, at the gate and on the dashboard.
- **Own fruit and bought-in fruit.** Outside suppliers' crews and deliveries are recorded alongside the farm's own, and paid or billed separately.
- **Hosted in South Africa.** Your farm lives at **yourfarm.plaashek.co.za** on a South African hosting service, so the data stays in the country, encrypted in transit and at rest, and backed up every day. Nothing to install or look after on a farm PC.
- **Apple or Android.** Plaashek runs in the browser on iPhone, iPad and Android phones and tablets, and installs to the home screen like an app. See Devices on the next page.

DEVICES

Works on Apple and Android

There is nothing to install from an app store. Each screen opens in the browser on an iPhone, iPad or any Android phone or tablet, and is added to the home screen once so it opens full screen like an app. The office uses whatever PC, Mac or phone it already has.

Recommended field devices: Ulefone RugKing 3 Pro and RugKing 4 Pro

For the picking stations we recommend a rugged Android phone rather than a consumer tablet. The RugKing fits one hand, its camera reads the worker badges, it lasts a full day of picking, and it shrugs off dust, rain and the drops a tablet does not survive. Both are low-cost devices, so losing one is not a disaster.

	RugKing 3 Pro	RugKing 4 Pro
Best for	The slimmer, lighter choice for an induna who carries it all day.	The long-shift choice: a battery that lasts two days of capture without a charger.
Screen	6.56-inch HD+ display at 120 Hz, Corning Gorilla Glass 3. Big enough for the keypad, readable in sunlight.	
Toughness	IP68 and IP69K water and dust sealing (submersion and pressure washing), MIL-STD-810H drop and shock rating.	
Battery	5 700 mAh, about a full day of capture.	10 200 mAh, two days of capture; 18 W charging.
Processor and memory	Unisoc T7250 octa-core, 8 GB RAM, 128 GB storage.	Unisoc T7250 octa-core, 8 GB RAM, 256 GB storage.
Camera	48 MP rear camera with autofocus, which is what reads the worker's QR badge in a fraction of a second.	
Connectivity	4G LTE with dual SIM, Wi-Fi, GPS, NFC and Bluetooth. Capture carries on with no signal and syncs when the phone finds the network again.	
Software	Android 15.	
Weight	286 g, 12.9 mm thin.	405 g, the weight of the bigger battery.

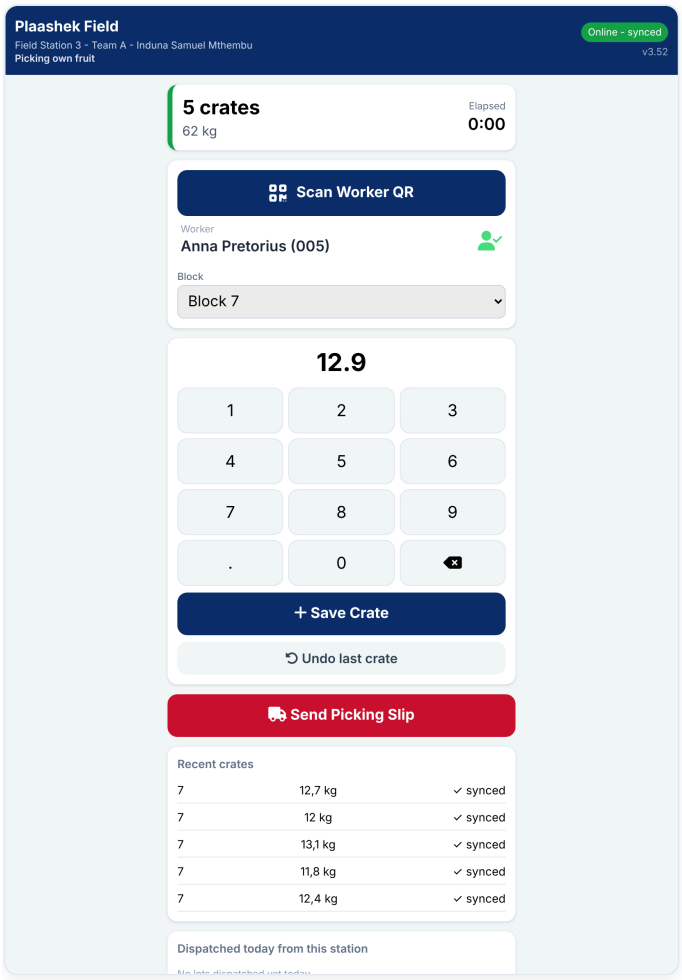

- **Any phone works.** The RugKings are a recommendation, not a requirement. A farm that already has tablets or phones can use them as they are.
- **Pack house and office.** The receiving screen runs on a tablet or phone at the gate; the office uses a PC, laptop or phone browser.
- **One address.** Every device opens yourfarm.plaashek.co.za and picks its role once.
- **Badges, not logins.** A field phone is paired to the farm once; workers identify themselves with their printed badge.

> Specifications as published by the manufacturer at the time of writing. Check the current model before buying.

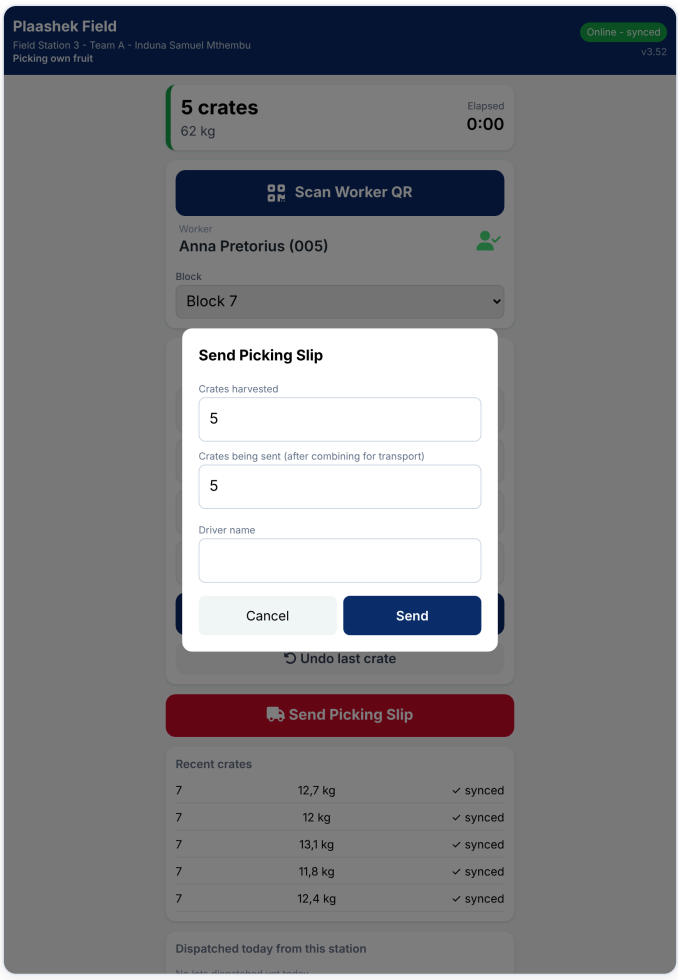

FIELD

Crate capture at the picking station

The induna's tablet. Scan the picker's badge, type the weight on the big keypad, save. The load card at the top counts crates and kilograms and shows how long the load has been standing.

Capture: worker scanned, weight typed, five crates already on this load.

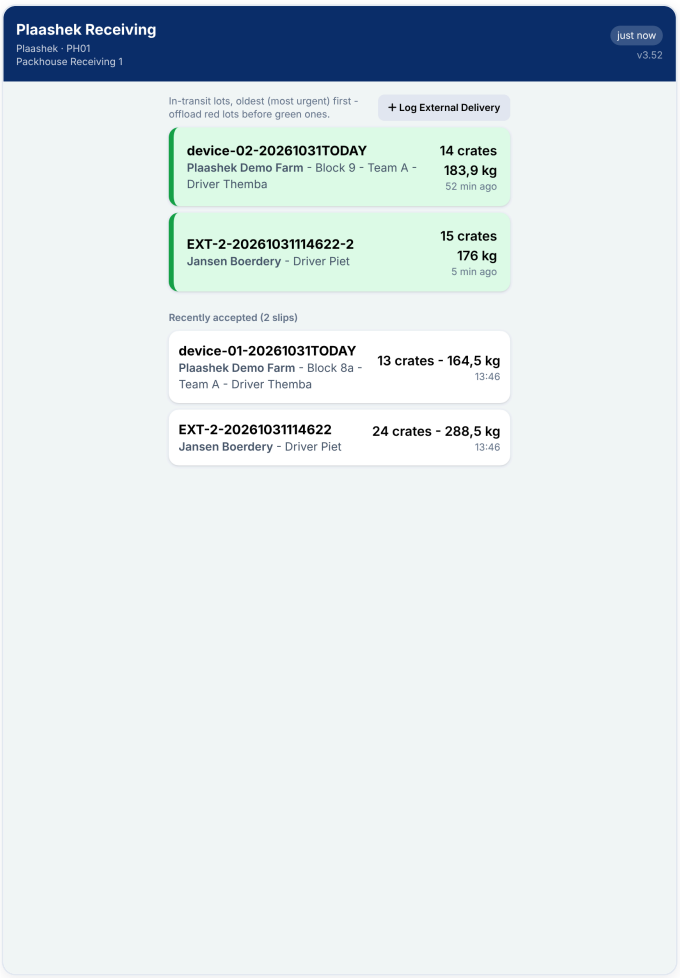

Send Picking Slip: the load goes to the pack house with the driver's name.

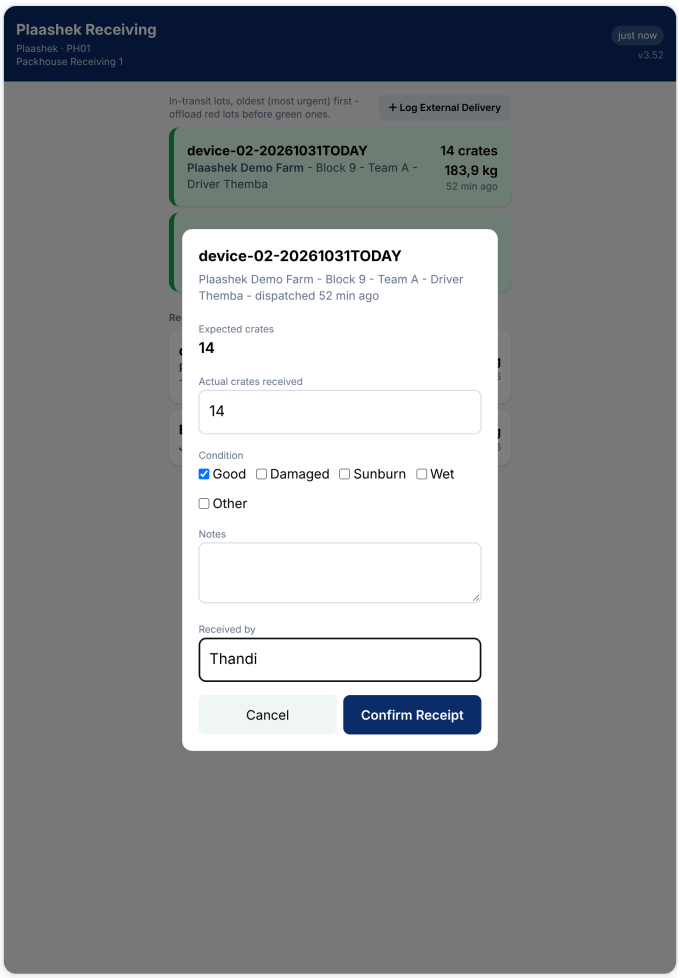

- **Saves before it syncs.** Every crate is written to the tablet first and sent in the background. The pill in the header shows synced, syncing or offline with the number still pending.
- **One-handed keypad.** Large keys, a decimal point and backspace. Undo takes back the last crate.
- **Block picker.** The block being picked is chosen once and stays until it is changed.
- **Split loads.** If the truck cannot take everything, send part of the load; the rest rolls onto a new slip automatically.
- **Recent crates and today's loads** stay on screen so the induna can check what has gone.
- **Elapsed clock.** The load card changes colour as the crates wait, so the team sees for themselves when a load should go.

Receiving at the gate

Every load on its way is a card, oldest first, coloured by how long it has been in transit. Tap one to check it in with the actual crate count, the fruit's condition and who received it.

The in-transit queue, with the loads already accepted today below it.

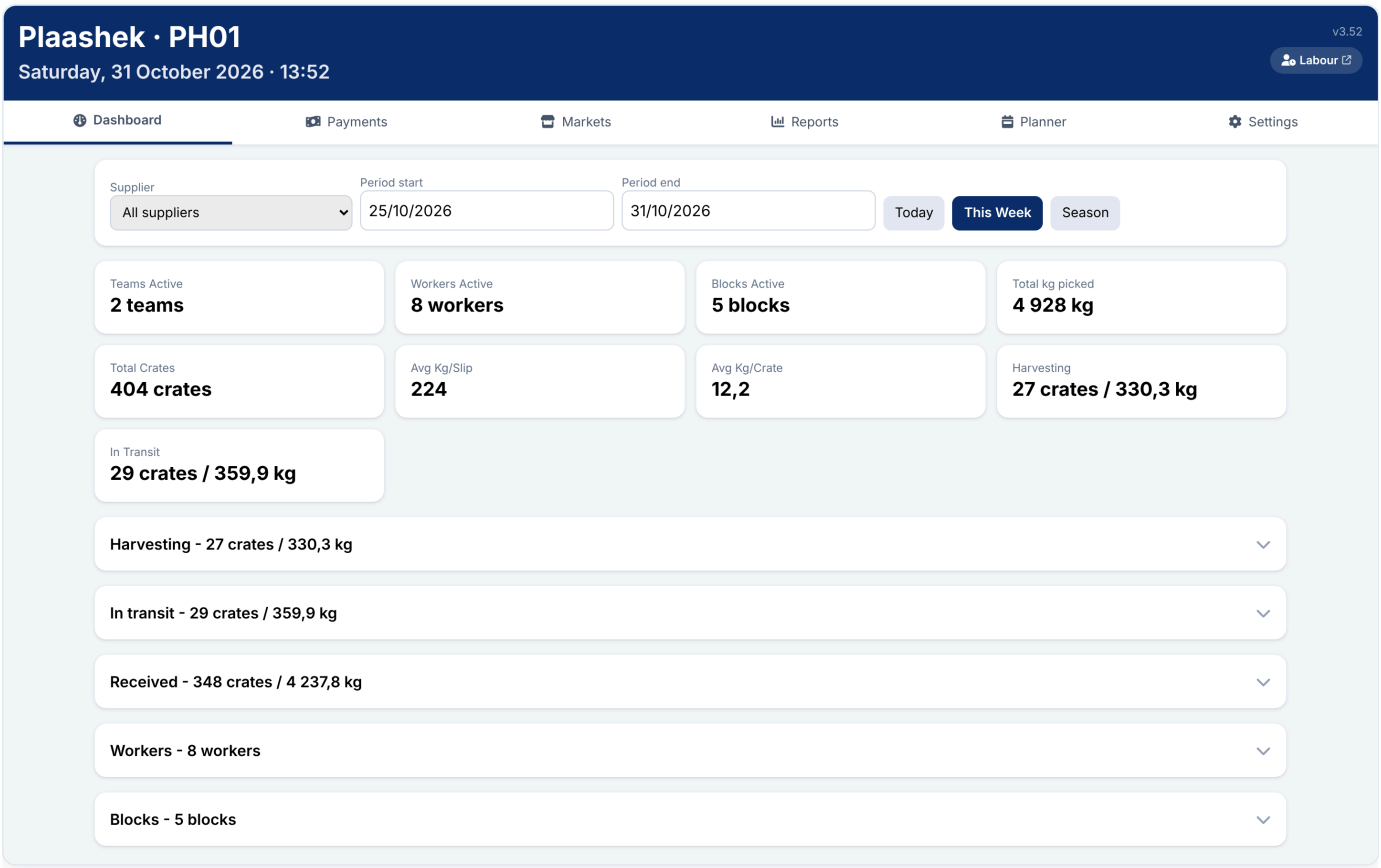

Receive: expected against actual, condition ticks, notes and the receiver's name.

- **Expected vs received.** The slip's crate count is shown read-only beside what actually arrived, so shortfalls are recorded, not argued about later.
- **Condition at a glance.** Good, damaged, sunburn, wet or other, any combination.
- **External deliveries.** Fruit from another farmer is logged at the gate with supplier, crates, kilograms and driver, and flows into the same queue.
- **Received once only.** A load cannot be checked in twice, however many times a button is tapped or a slip is re-sent.
- **Keeps its last list offline.** If the Wi-Fi drops, the screen keeps showing the last queue it loaded, marked with its age.
- **Feeds the office.** The receiving time and count are what the dashboard and reports call "received".

ADMIN

Dashboard

The office's landing screen: the whole farm for any period, with one filter bar. Today, this week, the season or any dates, for all suppliers or one.

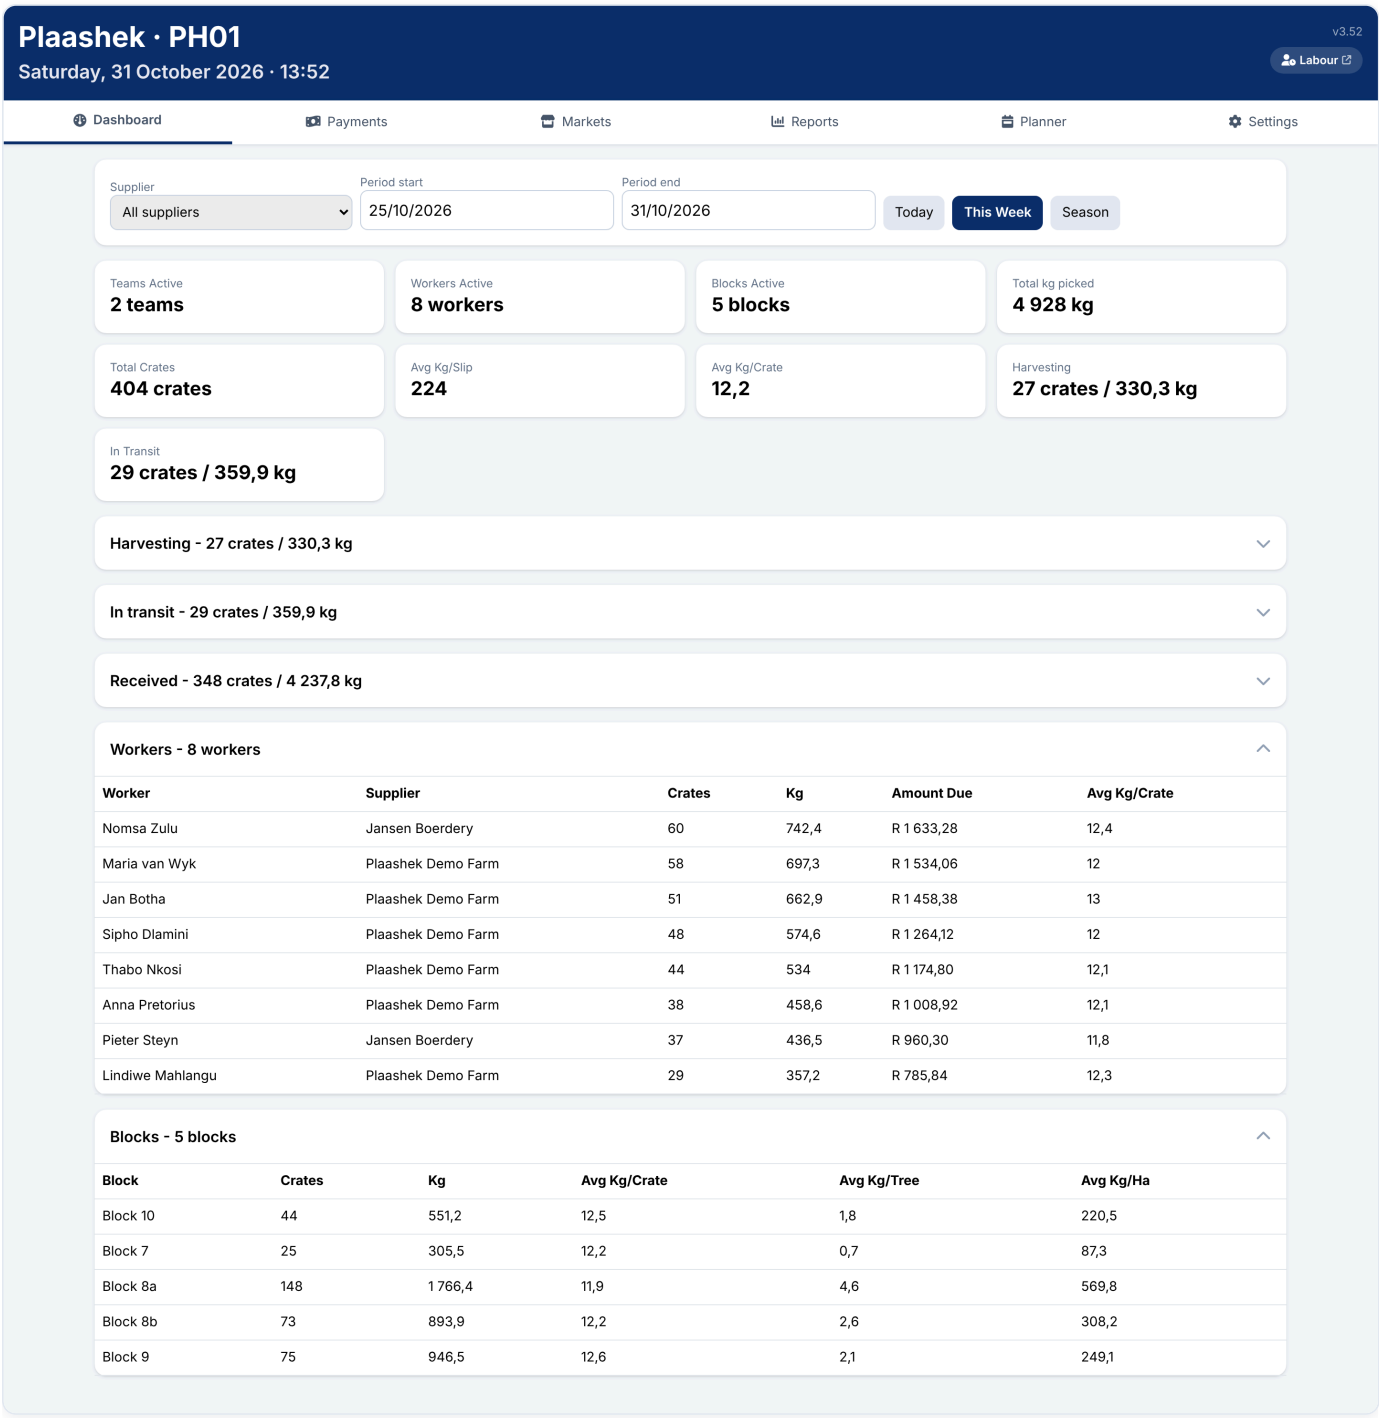

This week at a glance: teams, workers and blocks active, kilograms and crates, averages, and what is still harvesting or in transit.

- **Live KPI cards** for the chosen period: total kg and crates, average kg per slip and per crate, loads harvesting and in transit.
- **Five drill-down lists.** Harvesting, in transit, received, workers and blocks, each collapsed to its total until tapped.
- **Correct a crate.** Open a received load to see its crates and fix a wrong worker or weight, with the change recorded.
- **Per block yields.** Kilograms per tree and per hectare, from the block register.

Dashboard: workers and blocks

Expanding a list shows the detail rows. Workers are ranked by kilograms picked with the amount they have earned; blocks show their yield per tree and per hectare.

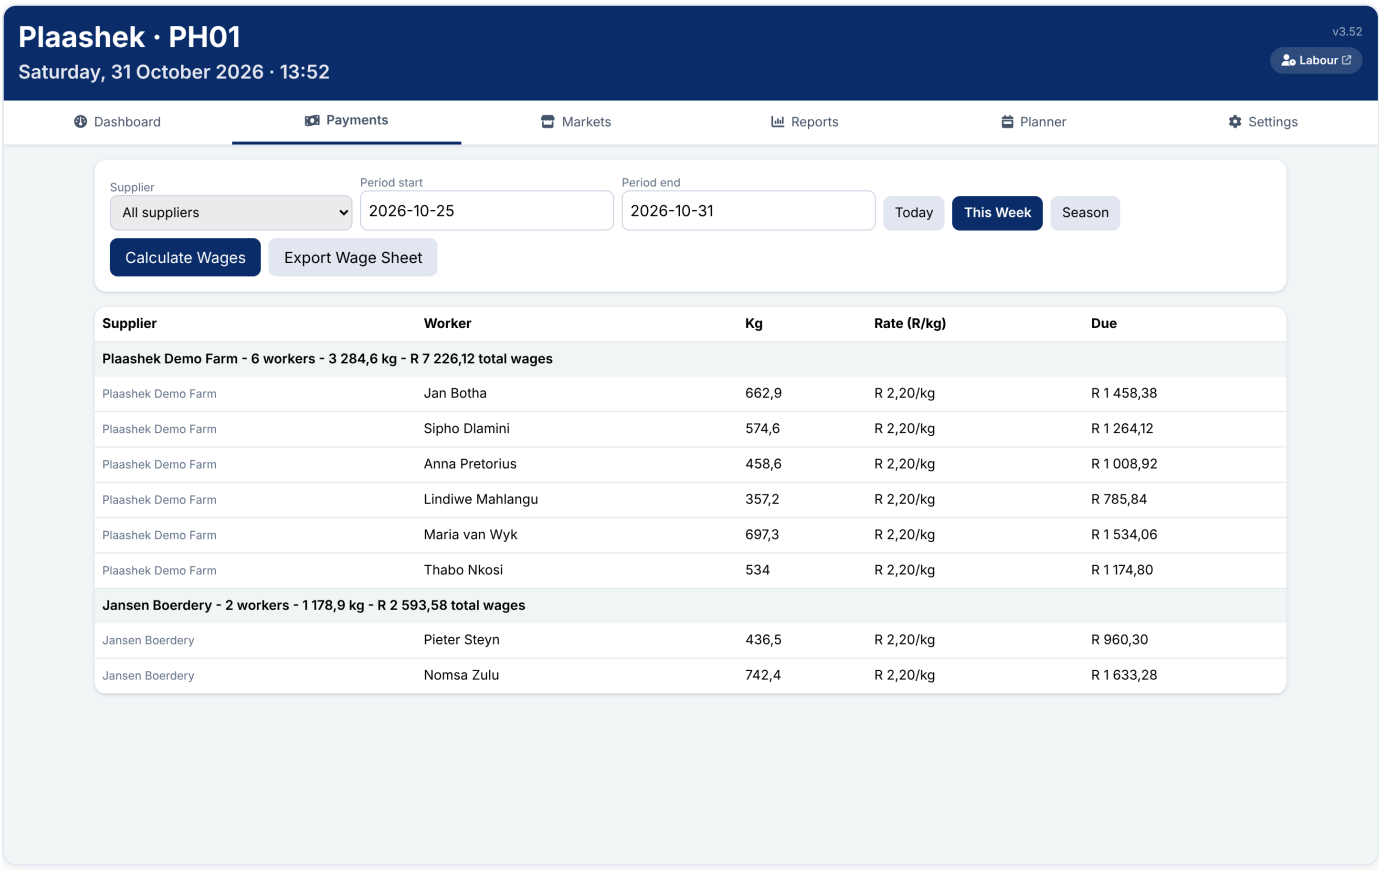

The Workers and Blocks lists open for the week.

ADMIN

Payments

Picker pay per kilogram, calculated from the crates captured in the field. Pick the period, press Calculate Wages, and export the wage sheet.

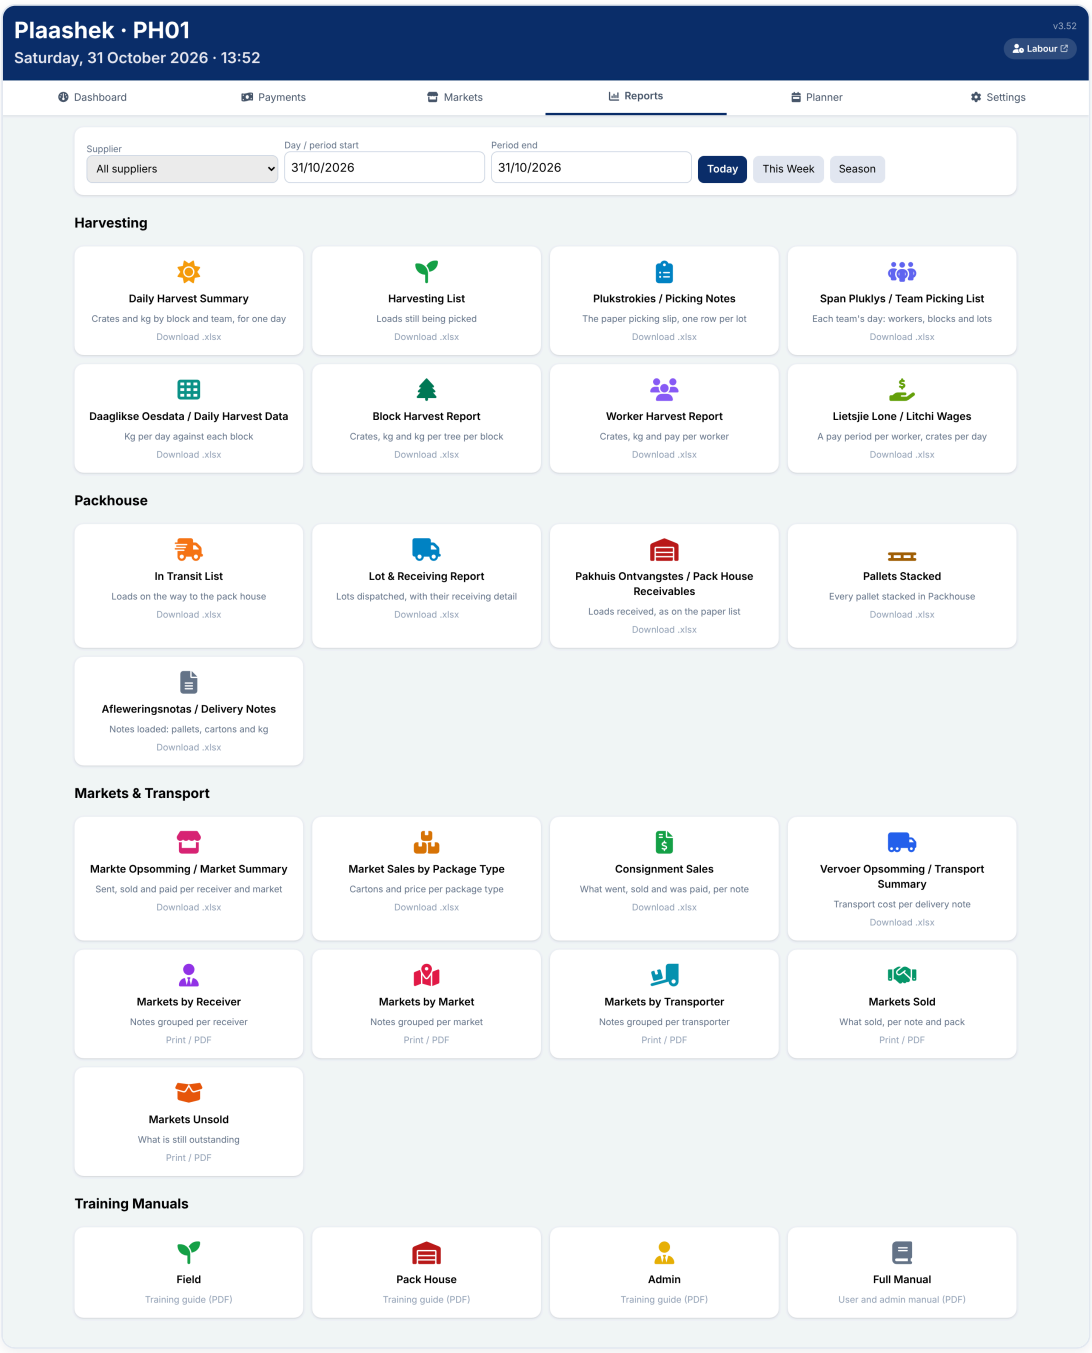

The week's wage run, grouped by supplier with a subtotal for each.

- **Rate per kg,** or tiered rates, set in Settings and dated so the history stays right.
- **Grouped by supplier.** The farm's own pickers and each outside crew have their own subtotal.
- **Export to Excel** for the payroll office, in the same layout.
- **Never a R0 wage sheet.** The run refuses to calculate without a rate, rather than printing zeros.

ADMIN

Reports

Every paper form the pack house used to fill in by hand, produced from the data already captured. One click downloads an Excel file for the chosen period.

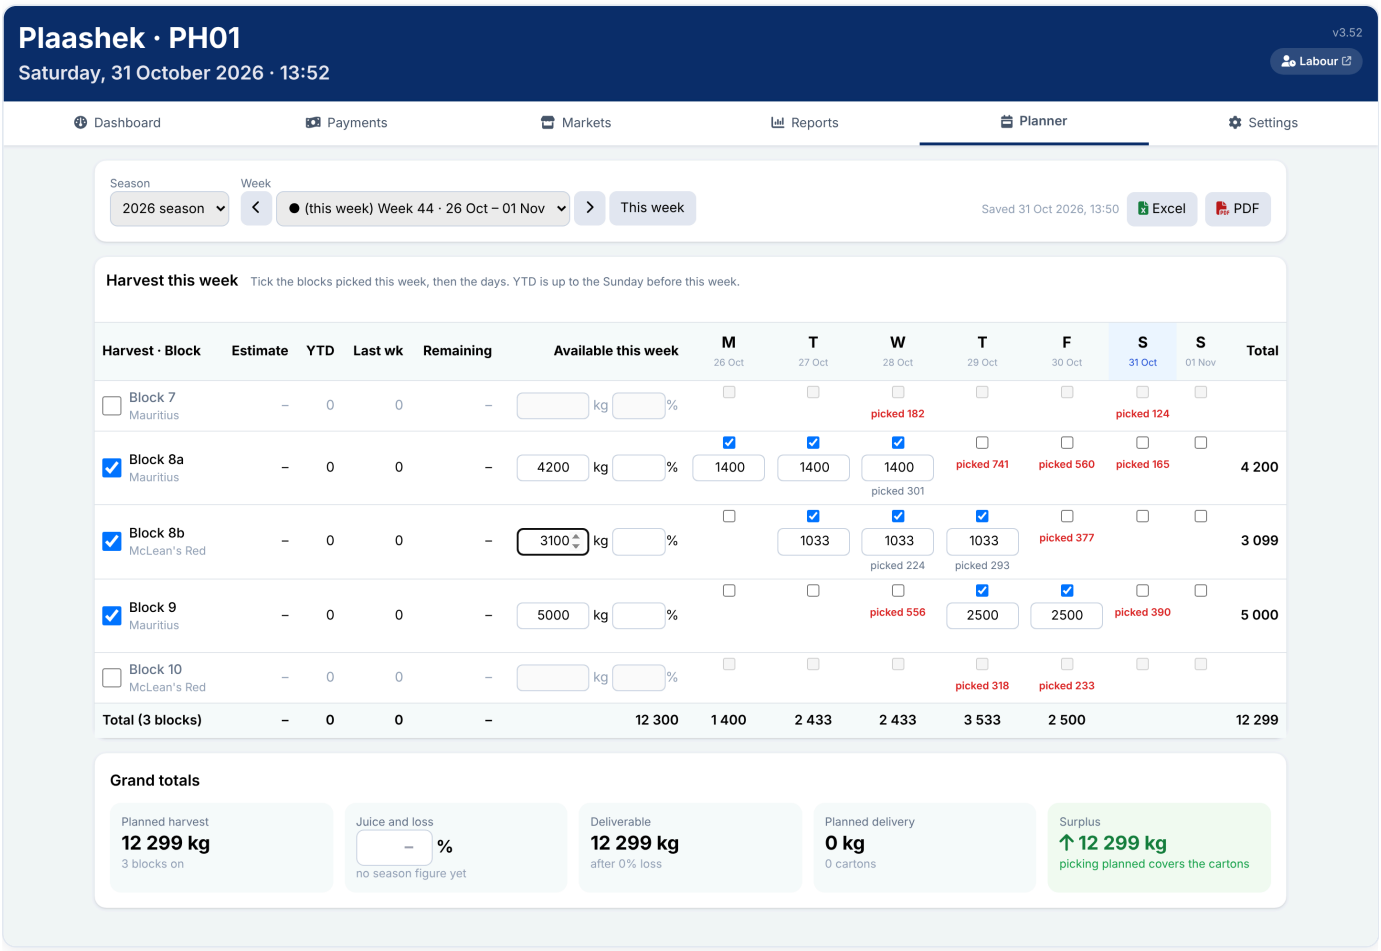

The report catalogue: harvesting, pack house, markets and transport, plus the training guides.

- **Harvesting:** daily harvest summary, picking notes, team picking lists, daily harvest data, block and worker reports, wages.
- **Pack house:** in-transit list, lot and receiving report, receivables, pallets stacked, delivery notes.
- **Markets and transport:** sales per receiver, market and package type, consignment sales, transport cost, sold and unsold.
- **Afrikaans and English** names on the forms the farm already knows.

ADMIN

Planner

The week's harvest plan. Tick the blocks to pick and the days, type what is available, and the plan spreads the kilograms across the days. What was actually picked shows in red under each day as the week runs.

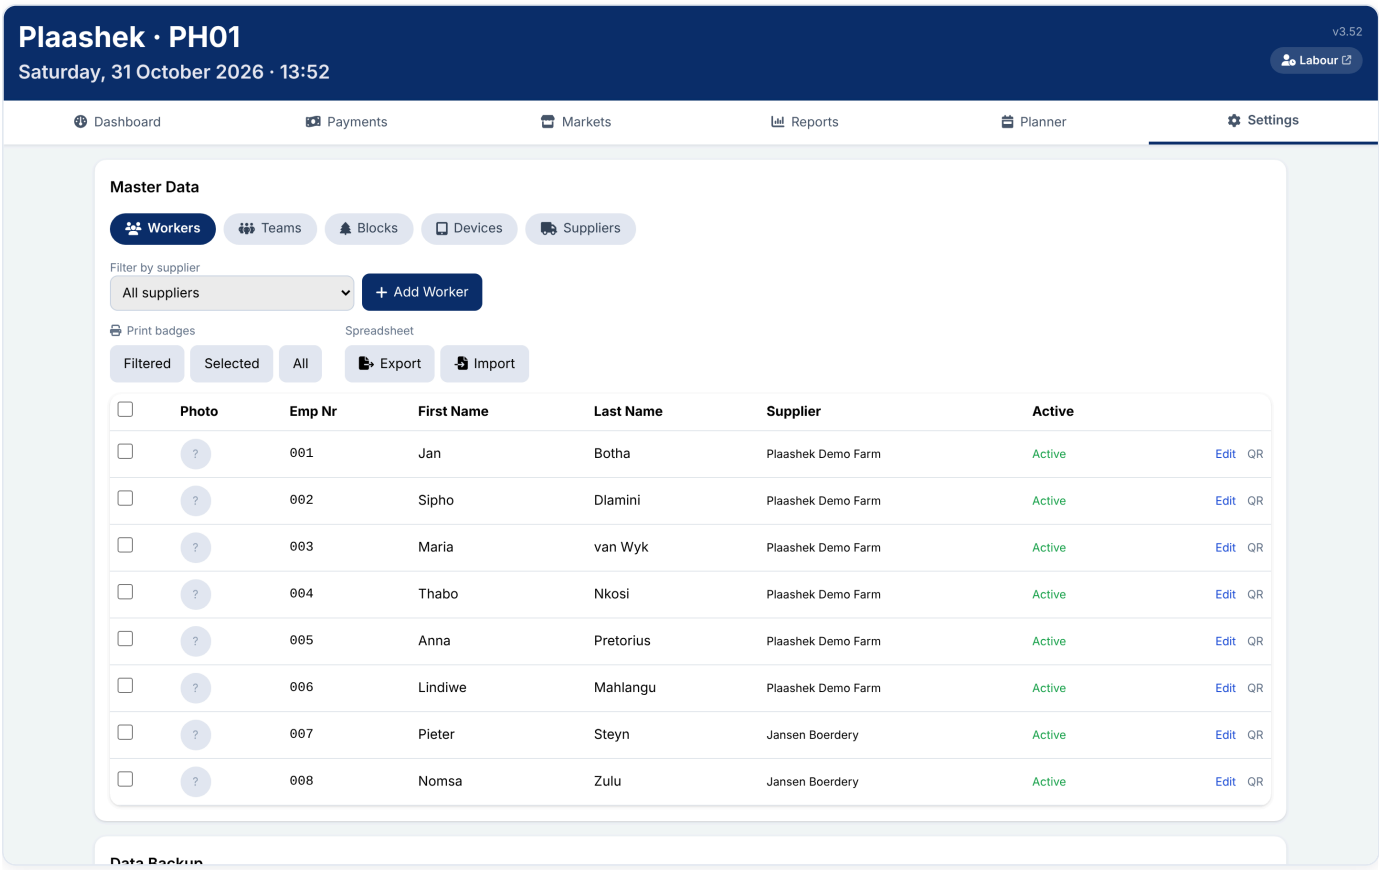

Week 44 planned: three blocks on, kilograms shared over the ticked days, grand totals below.

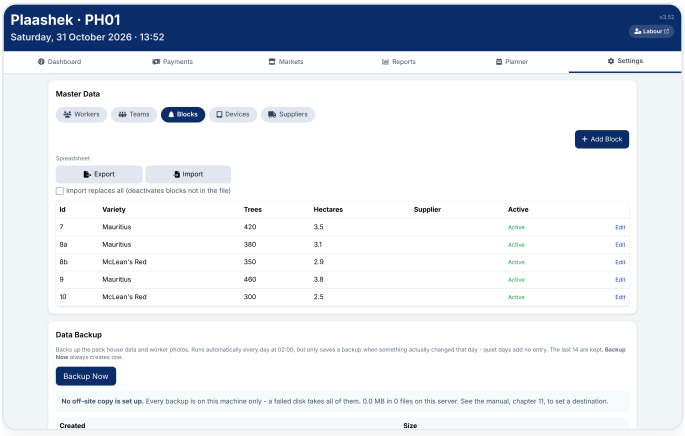

- **Plan against actual.** Picked figures appear under the day they were picked, planned or not.
- **Hold a day's figure.** Type a number on a day and the rest is re-shared around it.
- **Season estimate and deliveries** join the plan when the owner's crop estimate and the pack-house modules are installed.
- **Excel and PDF** of the week's plan for the morning meeting.

Master data

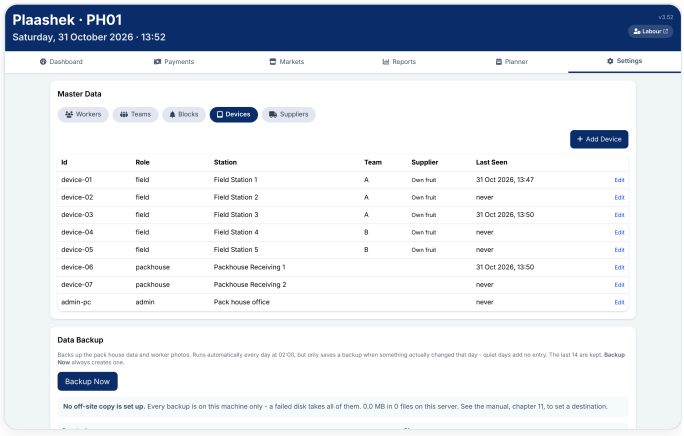

Workers, teams, blocks, devices and suppliers live in Settings. Each list imports and exports as a spreadsheet, so the season's register is set up in minutes.

Workers: the register with supplier, active flag, photo and QR badge.

Blocks: variety, trees and hectares, which drive the yield figures.

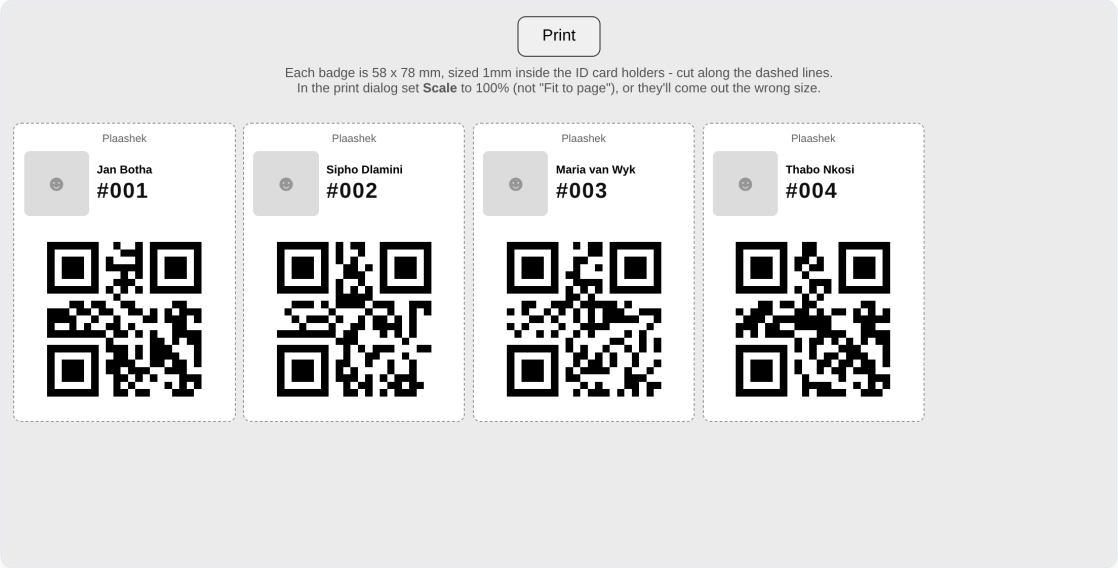

Devices: each tablet's role, station, team and when it last synced.

ADMIN

Worker badges

Print a badge for any worker, a filtered list or everyone. The QR code is what the field tablet scans, and the same badge works at the pack-house time clock.

Badges sized for standard ID card holders, with the worker's photo when one is on file.

Also included

Hosting and data	Each farm has its own address, **yourfarm.plaashek.co.za**, and its own database on a South African hosting service. Data is encrypted in transit and at rest, backed up daily, and never shared between farms.
Markets	With the pack-house module, delivery notes come through to the Markets tab, where the market's statement and the transporter's invoice are typed in, or read automatically from the agents' emailed invoices.
Weather	Current conditions in the header from the farm's weather station or its GPS position.
Updates	New releases are rolled out on the hosting service; there is nothing for the farm to install. Each screen shows the version it is running.
Training	A training guide per role (Field, Pack House, Admin) and a full manual, opened from the Reports tab.

> Plaashek Harvest is one module of the Plaashek suite. The pack-house, time-clock, owner's view, cattle and farm-notes modules each follow in their own section.

PRODUCT OVERVIEW

Plaashek

Packhouse: from the receiving dock to the truck

Everything that happens to the fruit after it is checked in, until a pallet or a juice bin leaves on a truck: sulfur tents, acid baths, pallet stacking, delivery notes and export paperwork, on the phones and tablets the floor already carries. And any other process that happens in your pack house can be added as a screen of its own.

Treatment
Sulfur tent and acid bath timers with a suggested dose and time, overrun alarms and the daily sulfur log.

Pallet Stack
Scan each pallet's label, record what is on it, and see the day grouped by market.

Delivery and juice
Tick pallets onto a delivery note, print or share it, and weigh juice bins onto their own note.

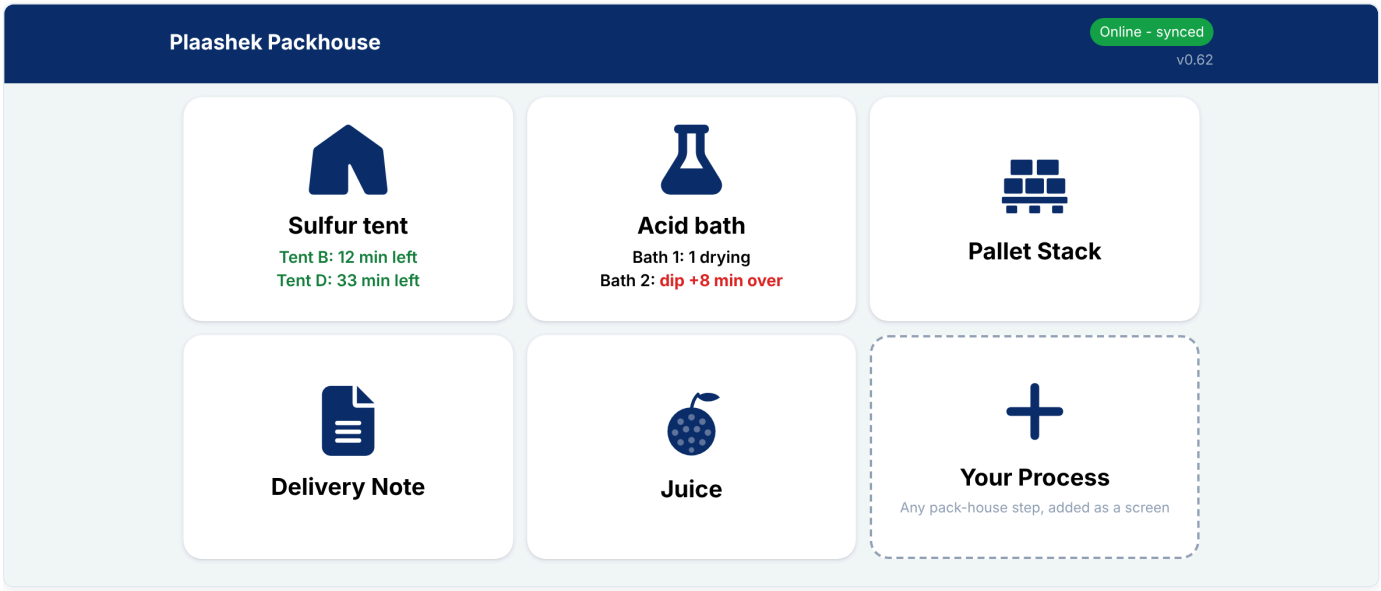

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; names, blocks and figures are invented.

HOW IT FITS TOGETHER

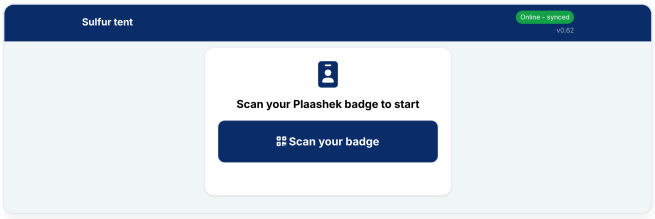

The fruit's route through the pack house

Plaashek Packhouse picks up where Plaashek Harvest's receiving screen leaves off. The blocks, suppliers and workers come straight from Harvest, so nothing is typed twice, and every record names the worker whose badge opened the screen.

Received → Sulfur tent → Acid bath → Pack → Pallet Stack → Delivery note → Truck

Home: one big tile per process, with what is running on it right now. A farm switches on the ones it uses, and any other pack-house step is added as its own tile.

Every floor screen opens with a worker's badge scan, the same badge the field uses.

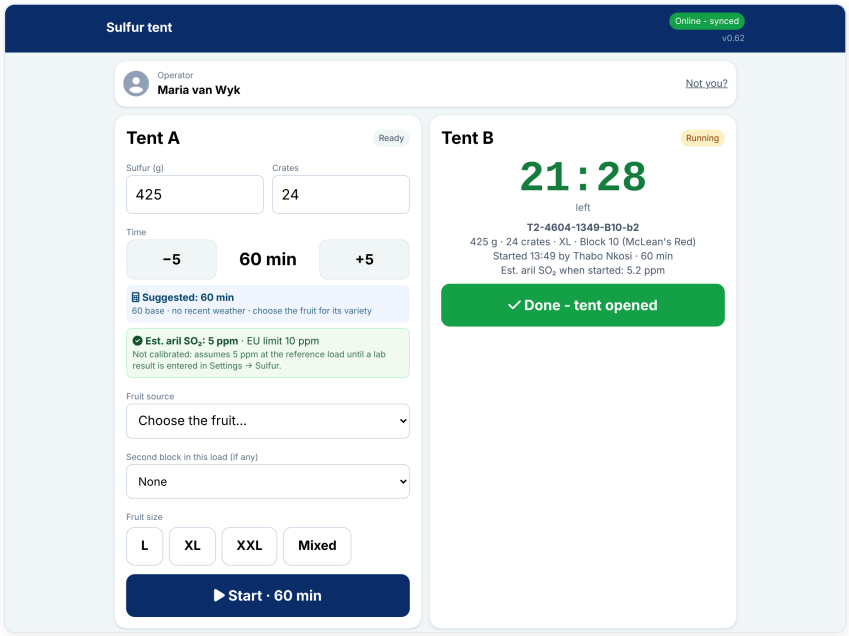

Built for a pack-house floor

- **Works on Apple and Android.** Tablets for the tents and baths, phones for pallets and delivery notes. Nothing to install from an app store.
- **Offline on patchy Wi-Fi.** A run, batch, pallet or note is saved on the device first and sent when the signal is back. Two tablets never fight over a record.
- **Badges, not logins.** A scan of the worker's badge signs them in for the shift. "Who did this" is on every record.
- **Settings behind a PIN.** The floor screens have no password; the lists, numbers and backups are behind a four-digit PIN that signs out when the tablet is left.
- **Harvest's data, read only.** Blocks, varieties, bought-in suppliers and the day's received lots are offered where they are needed, never retyped.
- **Your process, your screen.** Sulfur, acid, pallets, delivery notes and juice are the steps one pack house needed. A grading line, cold store, pre-pack, fumigation or any other step in your pack house can be added as a screen of its own, with the same badge sign-in, offline capture and reports.
- **Hosted in South Africa** at yourfarm.plaashek.co.za, with daily backups.

TREATMENT

Sulfur tent

One card per tent. Load the grams, crates, fruit and size, press Start, and the tablet counts down. A tent left too long sounds an alarm on every screen in the pack house.

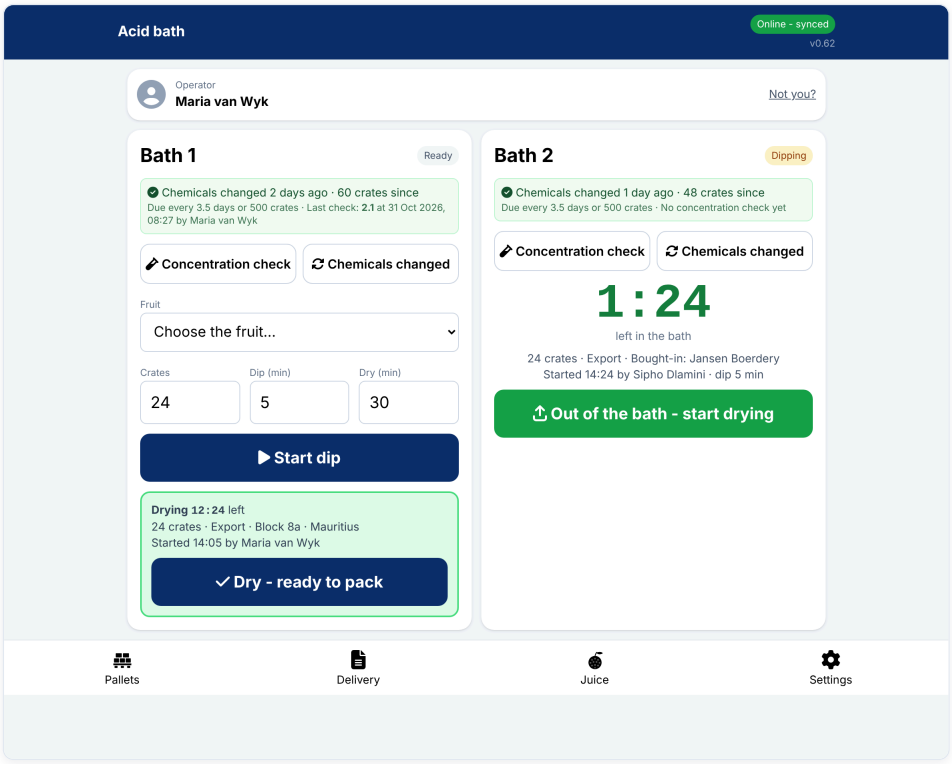

Tent A ready to load with a suggested time and the SO_2 estimate; Tent B running with its countdown and batch number.

- **Suggested time.** A transparent starting rule the farm tunes: the tent's default time, scaled by fruit per gram, today's weather and the variety. The operator always sees why, and can step it up or down.
- **Aril SO_2 estimate.** Shown live against the EU limit, amber from 8 ppm and red from 10, and marked "not calibrated" until a lab result is entered.
- **Batch number on every run.** Tent, date code, time, blocks and a short id, printed on the daily log and carried to the acid bath and the pallet.
- **Fruit from Harvest.** The fruit picker offers today's received blocks and suppliers, with a second block for a mixed load.
- **Overrun alarm.** The screen stays awake while a tent runs and sounds when a tent is overdue, on the sulfur screen and the home screen.
- **Weather stamped.** Temperature and humidity are recorded with each run, for tuning the rule later.

TREATMENT

Acid bath

The sulfur tent's technique, step for step: a batch is dipping, then drying, then done. Each bath shows when its chemicals are due, by days or by crates since the last change.

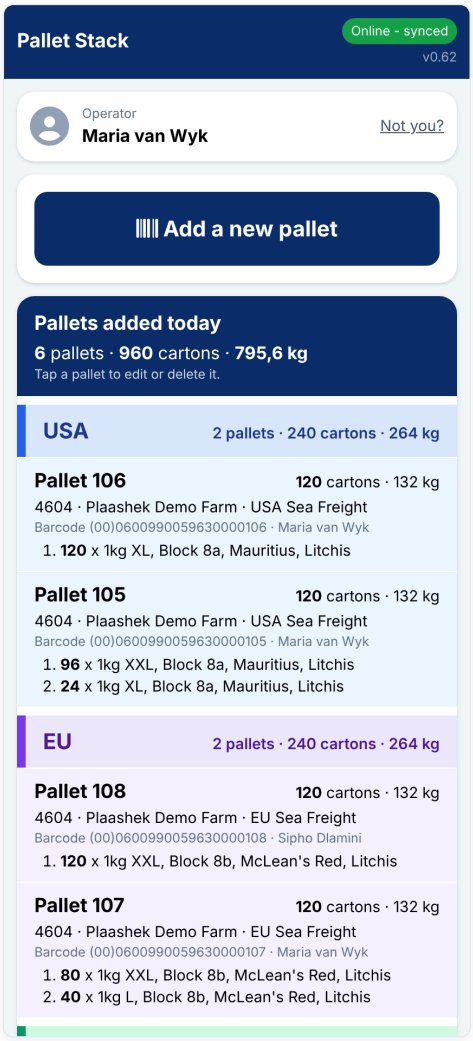

Bath 1 ready with a batch drying below it; Bath 2 mid-dip with the countdown and a bought-in load.

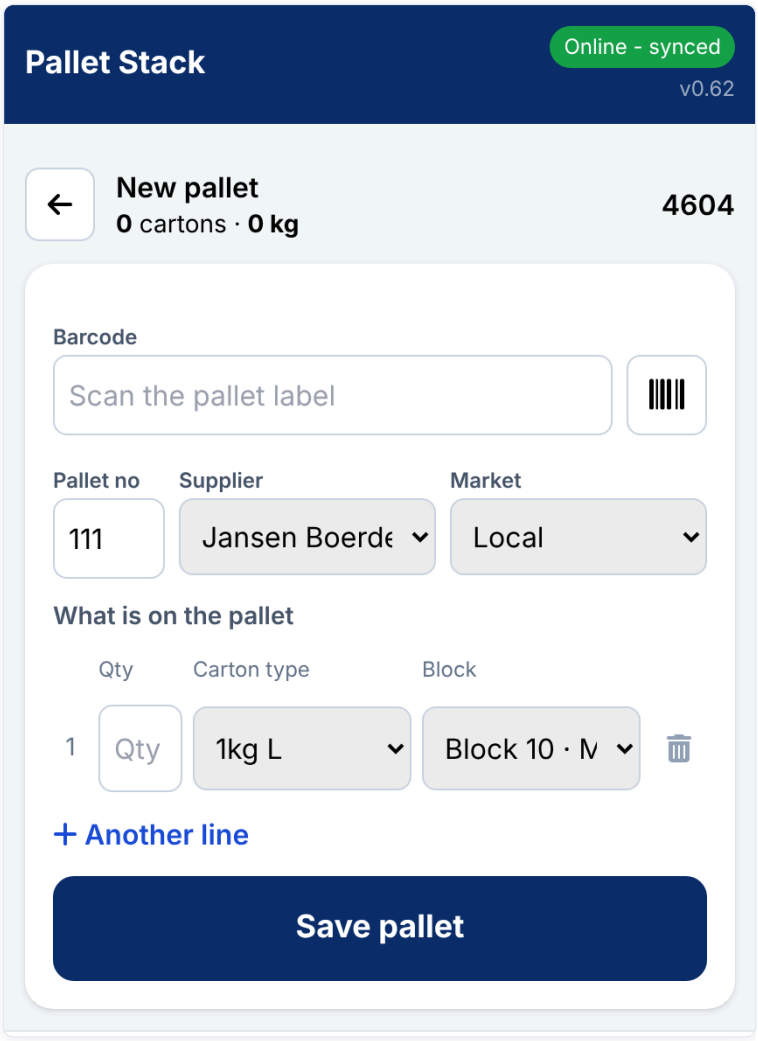

- **Dip and dry timers.** A dip left in sounds the alarm; drying only says ready to pack.
- **Chemical health.** Days and crates since the last change against the bath's own limits, with a concentration check recorded beside it.
- **Export from finished sulfur runs.** An export batch is picked from the runs not yet dipped, its block and crates copied in; local fruit comes straight from the day's receipts.
- **Every stage one way.** A batch cannot be reopened by a stale copy from another tablet.

Pallet Stack

The paper consignment sheet, on a phone. Scan the pallet label, pick the supplier and market, and list what is on it: cartons, carton type and block. The day builds up under USA, EU and Local headings with their totals.

Pallets added today, grouped by market with cartons and kilograms per group.

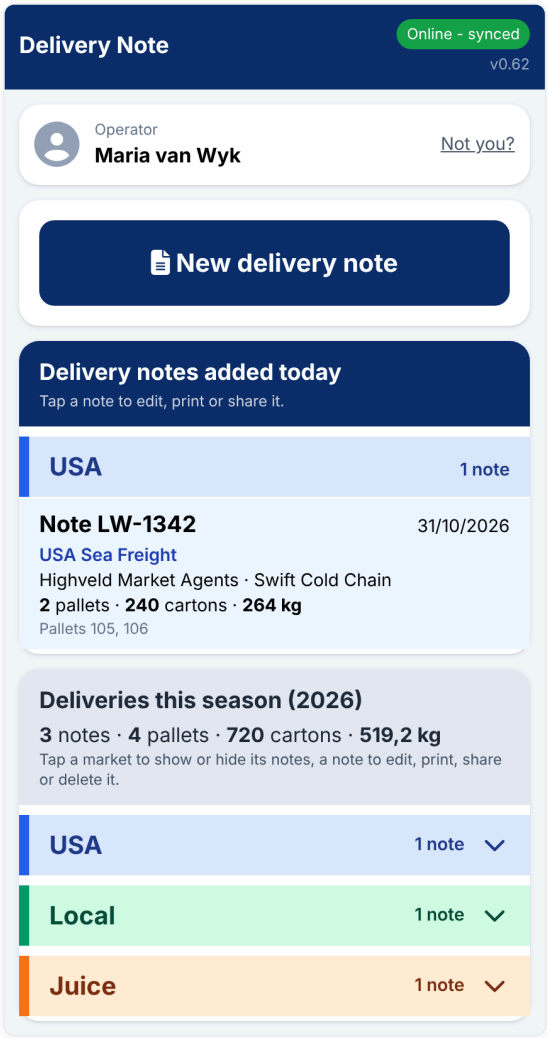

New pallet: scan the label, the next pallet number is offered, add a line per carton type.

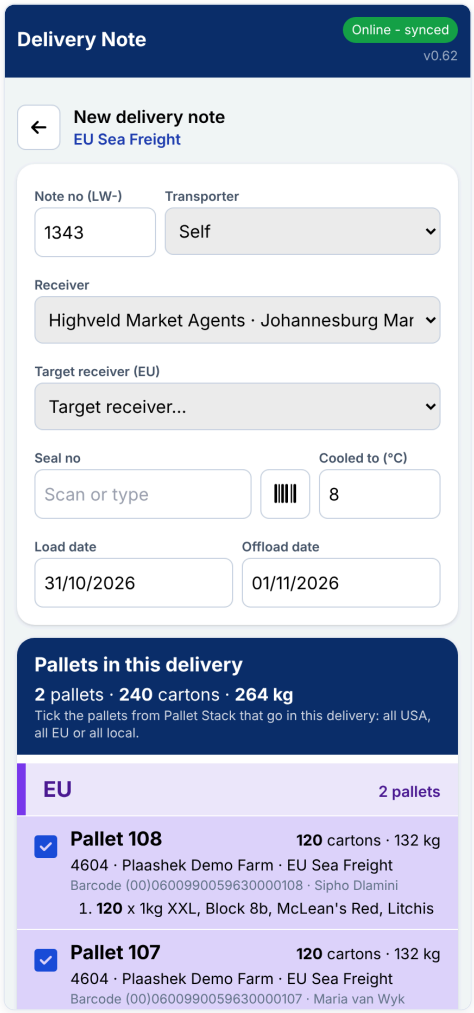

- **Scan twice, trust once.** The barcode is taken only when the camera reads it the same twice in a row, so a noisy label never lands on a pallet.
- **Unique for the season.** Pallet numbers and barcodes cannot be reused while a pallet is live; a removed pallet frees its number.
- **Carton weights from Settings.** Each line copies the carton's real weight, so kilograms on the note match the scale and old pallets never change.
- **Editable until it leaves.** Tap a pallet to change or delete it; the pallets of the whole season stay on the phone, folded by market.

Delivery Note

Tick the pallets going on the truck, pick the receiver and transporter, scan the seal, and the note is numbered, saved and ready to print or share from the phone.

Today's notes and the season's, by market. Tap one to edit, print or share.

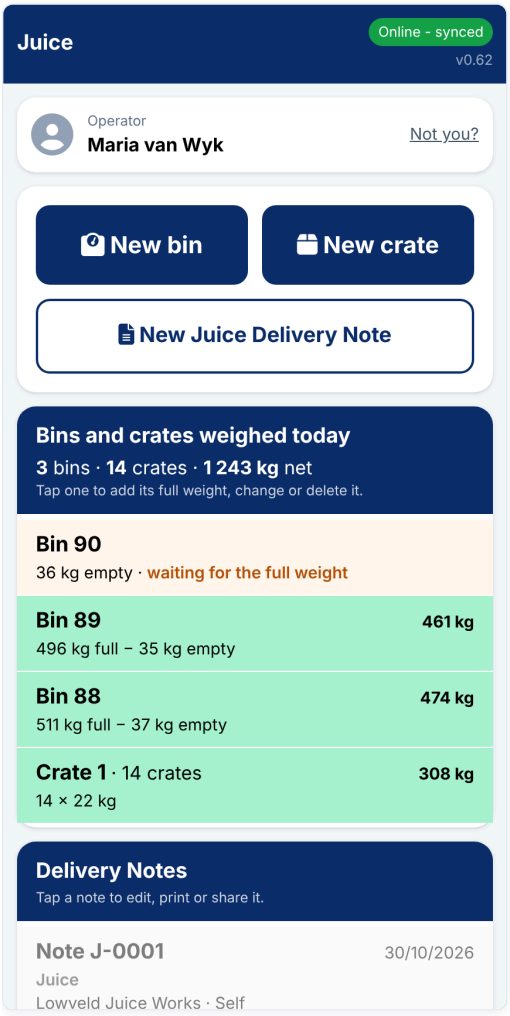

New note: once an EU pallet is ticked the other markets grey out, and the LW- number is offered.

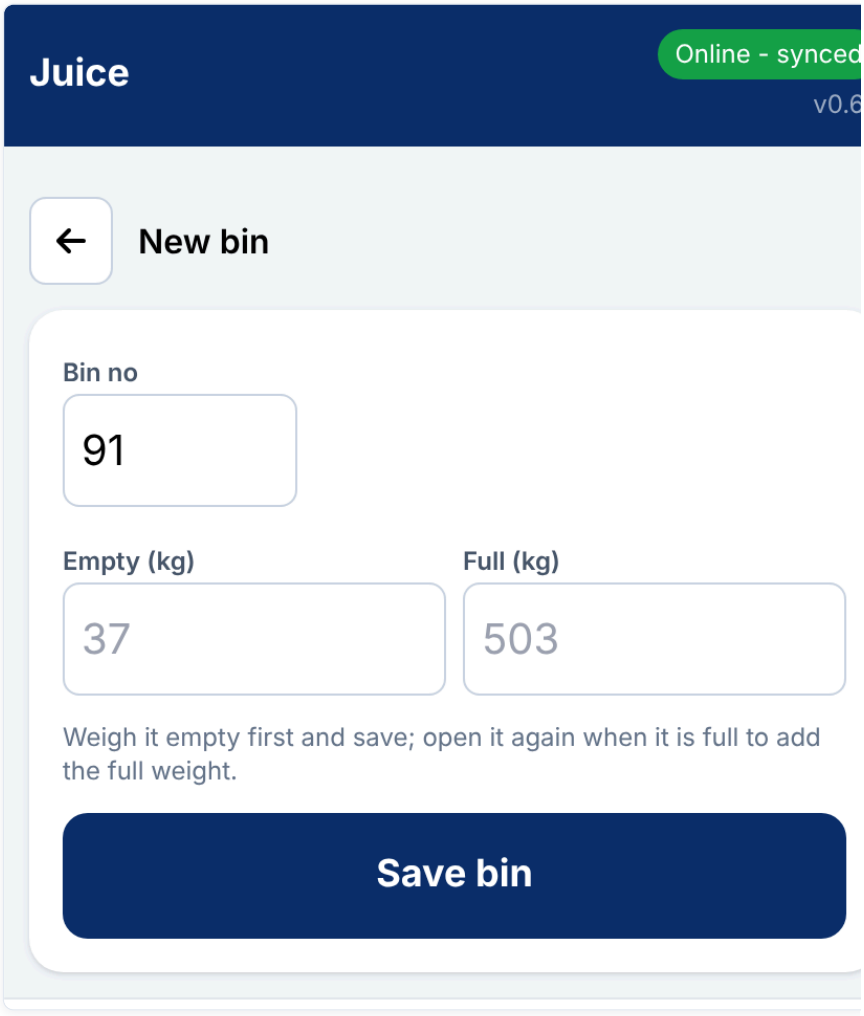

- **One market per note.** A note holds USA, EU or local pallets, never a mix, and a pallet is on at most one live note.
- **Local notes print the delivery note** as a PDF laid out like the paper one, in Afrikaans and English, with "page X of Y" and the signature boxes blank.
- **Export notes print the market's papers:** the phyto accompanying document, the consignment note and the PPECB inspection sheet, as Excel or PDF, with the farm's PUC, PHC and GGN filled in.
- **Receivers and transporters from Settings,** copied onto the note, so a note that has gone out never changes.
- **Deleting wants the PIN,** and frees the pallets for another note.

Juice bins and crates

Replaces the scale's two stickers per bin. Weigh a bin empty and save it; open it again when it is full. Full bins go on their own J- delivery note.

Bins still waiting for a weight first, then the full ones in green, then the juice notes.

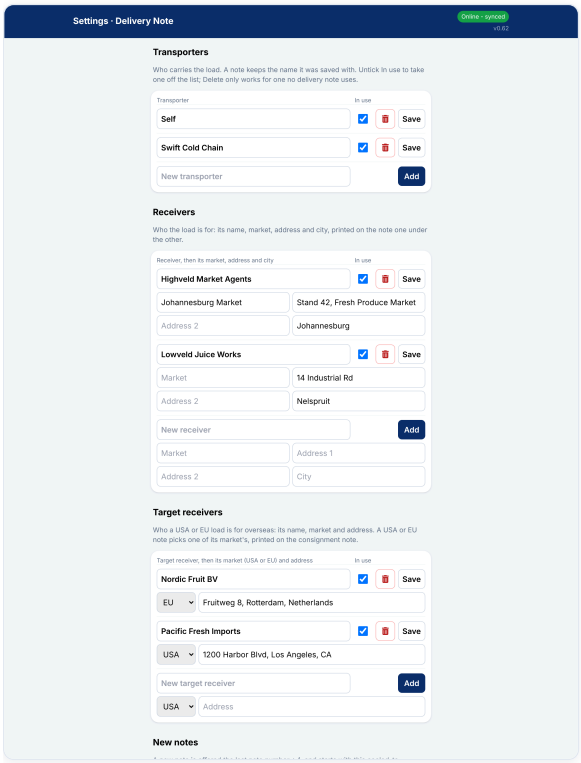

New bin: the next number offered, empty now and full later.

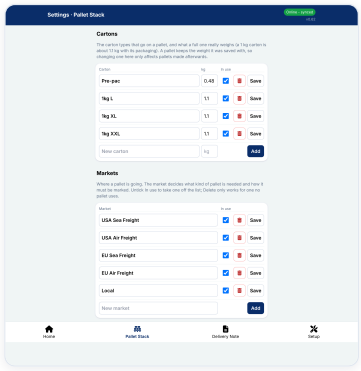

- **Crates by the batch.** A crate record is counted, not weighed: number of crates times weight per crate.
- **Own number series.** Juice notes run from J-0001, apart from the B- and LW- series.
- **Net weight on the note.** Full minus empty per bin, with the load's total.

Lists, numbers and the sulfur log

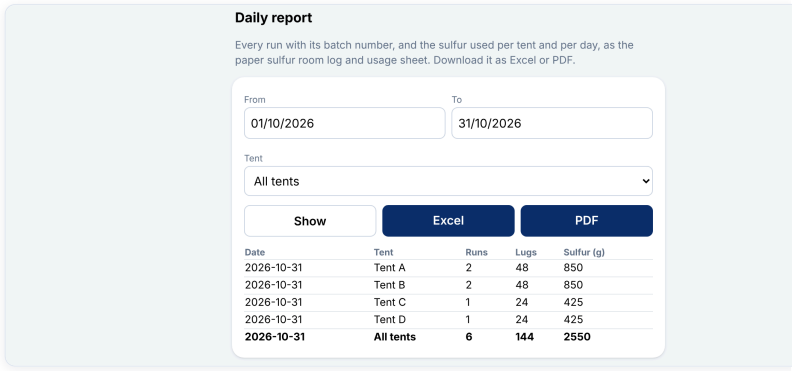

Behind the PIN: the tents and baths, the cartons and markets, the receivers, transporters and overseas target receivers, the suggested-time numbers, and the daily sulfur report.

Delivery Note settings: transporters, receivers, USA and EU target receivers, the next note number.

Cartons with their real weight, and the markets.

The sulfur room log and usage per tent per day, as a table, Excel or PDF.

Retire, never delete	A tent, bath, carton, market or receiver is unticked when no longer used, so old records keep their names.
Backups	A daily backup of the pack-house data, with Backup Now in Settings.
Settings PIN	Four digits, changed in Settings; five wrong tries lock it for five minutes. Pallet Stack and Delivery Note can also be opened with the PIN when no badge is at hand.
Hosting and data	Your farm lives at yourfarm.plaashek.co.za on a South African hosting service, encrypted in transit and at rest, backed up daily, never shared between farms.

> Plaashek Packhouse is one module of the Plaashek suite. It reads Plaashek Harvest's blocks, suppliers, workers and received lots; Harvest's office in turn reads the delivery notes for its Markets tab and planner. Any process that happens in your pack house, from grading to cold store to dispatch, can be added as a screen of its own.

PRODUCT OVERVIEW

Plaashek

Owner: the season against its own history

The owner's view of the farm, on a phone. What is being picked right now, how this season compares with every season on record, the weather that drove each of them, a transparent harvest-risk score, the owner's own crop estimate block by block, and what the fruit actually made at market.

Analysis

Season pace, yield per block and per tree, variety trends, season length and monthly volume, every season side by side.

Estimate and Risk

A per-block crop estimate with a pack-out mix, checked against a weather model built from the farm's own record.

Weather and Markets

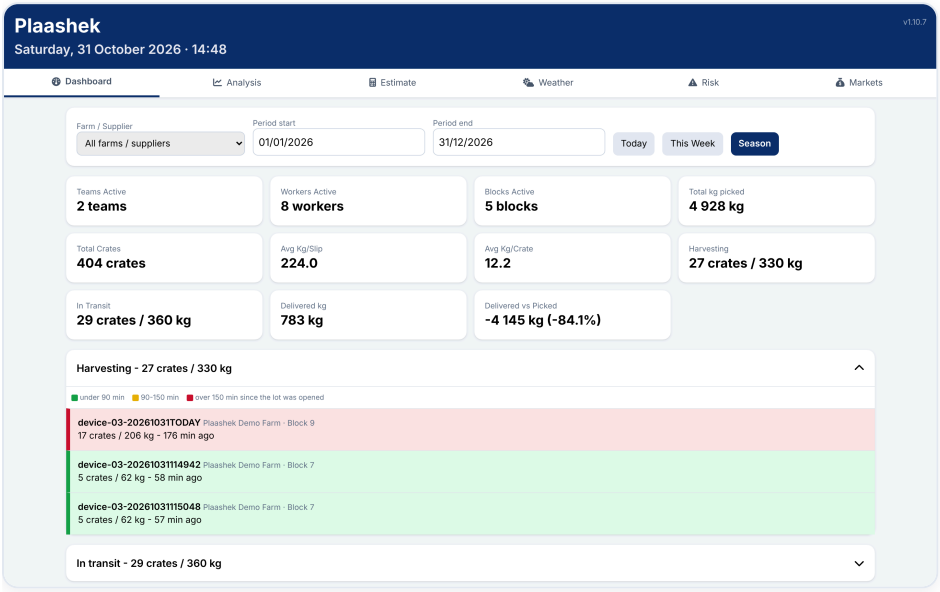

Hourly weather since 2012, and the prices the fruit made by pack type and buyer against a public reference.

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; seasons, weather and figures are invented.

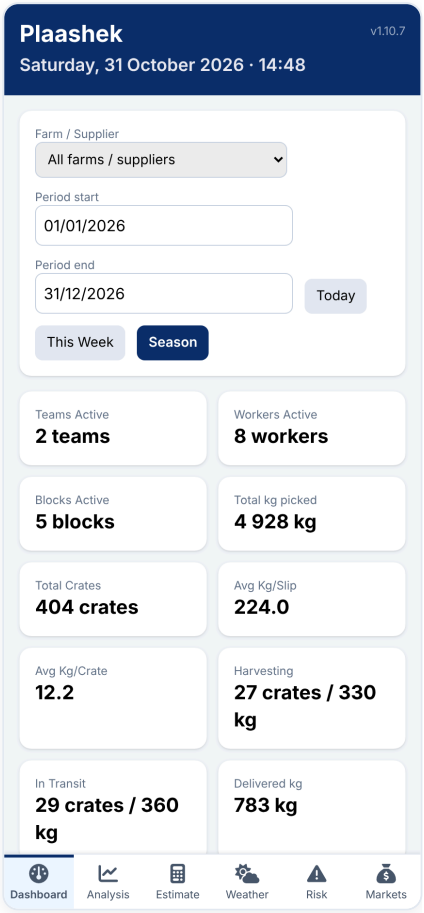

HOW IT FITS TOGETHER

The farm in the owner's pocket

Plaashek Owner reads the harvest that Plaashek Harvest captures and the delivery notes Packhouse makes, and adds what only the owner keeps: the seasons before the apps, the weather record, the crop estimate and the market statements. Nothing is captured twice. It is built phone first, with the same six tabs on a PC.

Dashboard: the season's figures from Harvest, including what is still being picked and in transit right now, and the kilograms delivered against picked.

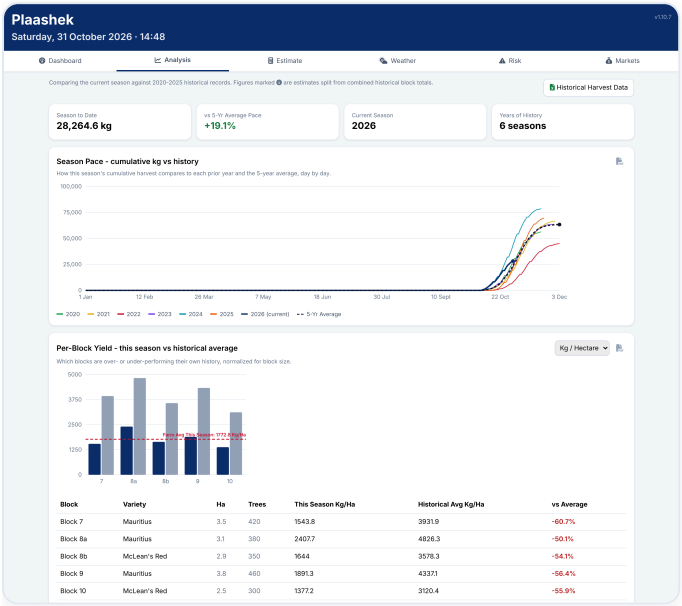

The same dashboard on a phone.

- **Phone first.** Six tabs: Dashboard, Analysis, Estimate, Weather, Risk and Markets. Every chart is drawn on the device and downloads as a PDF; every table as Excel.
- **Reads, never disturbs.** Harvest's and Packhouse's data are opened read only. The Estimate tab is the one screen that writes, into the owner's own database.
- **Seasons before the apps.** Past seasons are imported once from the farm's own spreadsheets, daily per block where the record has it and annual totals before that.
- **Weather on file.** Hourly weather for the farm's position, back to 2012, kept current every day from a weather service and, where the farm has one, its own station.
- **Optional AI help.** With a key on the server: ask about an estimate or the weather, check an estimate before saving, see what changed between two versions, and a short brief each morning. Without a key, everything else works.
- **Hosted in South Africa** at yourfarm.plaashek.co.za, with daily backups.

ANALYSIS

This season against every season

The current season laid over its own history, day by day. Which blocks are ahead or behind their average, which varieties are trending, how long each season ran and what each month contributed.

Season to date and pace against the five-year average; cumulative kilograms day by day; this season's yield per hectare against each block's own history.

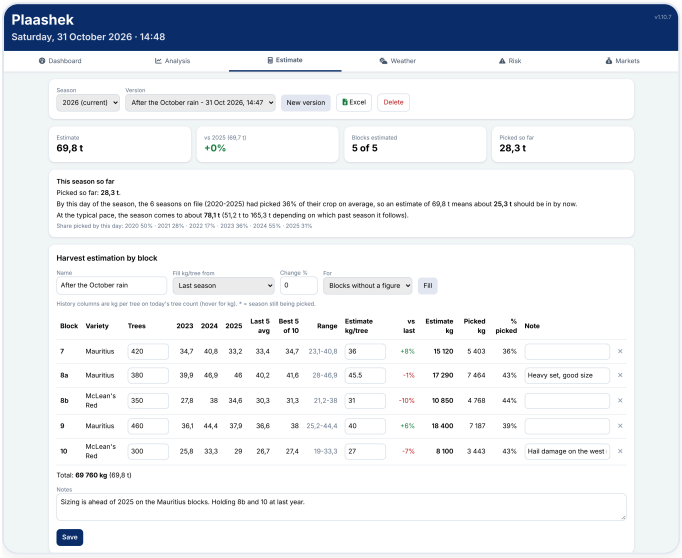

Harvest volume by block and season at a glance, and kilograms per tree for every block in every season as a heat map.

- **Season pace.** Cumulative kilograms against each prior year and the average, so a late or short season shows itself early.
- **Per block, normalised.** Kilograms per hectare and per tree, so a small block and a big one compare fairly.
- **Variety, length and month.** Average yield per variety over time, first pick to last pick per season, and a monthly heat map with each month's share.
- **The historical workbook.** One button downloads the whole record as a spreadsheet, the way the farm used to keep it.

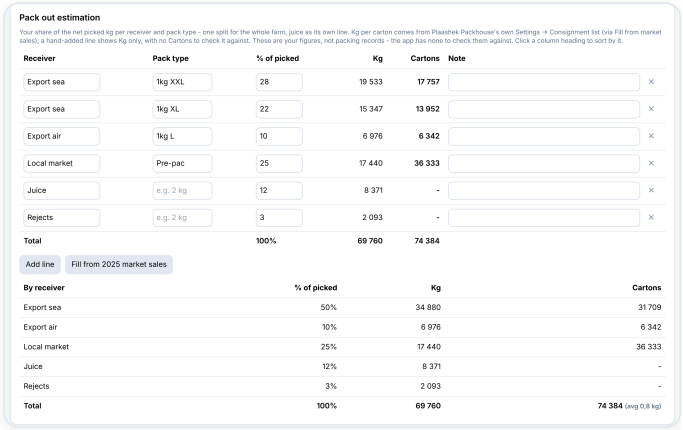

ESTIMATE

The owner's crop estimate, block by block

Every block in the register with its tree count and its history in kilograms per tree. Fill the estimate from last season or a past average, adjust the blocks that look different in the orchard, and save it as a version. As the season runs, the estimate is tracked against what is actually picked.

Version picker, totals, "this season so far" against the typical pace by this day, and the estimate table with each block's last three seasons, five-year average, best five of ten and range.

Pack-out estimation: the estimate split by receiver and pack type into kilograms and cartons, filled from last season's market sales in one tap.

- **Versions, not overwrites.** Each save is a version with a name, notes and the date. Compare versions and export any one to Excel.
- **Progress against the estimate.** What share of the crop past seasons had picked by this day, and where this season lands at that pace.
- **Pack-out mix.** Export, local, juice and rejects as percentages, turned into cartons per pack type with the pack house's own carton weights.

ESTIMATE

Cross-checked against the weather

Beside the owner's figure sits the weather model's: unfavourable, expected and favourable kilograms for the season, and the past seasons whose weather so far came closest, with what each of them produced.

Weather model cross-check — Worked out moments ago

Your estimate	Unfavorable	Expected	Favorable
69,8 t	58 t	60,5 t 2 of 4 factors settled	64,5 t

Your estimate is 15.3% (9,3 t) above the model's Expected, above even its best-weather case.

Version	Model as at	Estimate	Model Expected (Unf.-Fav.)	vs model
After the October rain	24 Oct 2026, 06:00	69,8 t	66,1 t (58,9 t-72,6 t)	+6%
Early look, 2 Oct	02 Oct 2026, 06:00	66,7 t	64,9 t (57,2 t-71,8 t)	+3%

What each number is built from

Weather model cross-check: the estimate placed on the model's range, and each version against the model as it stood when that version was saved.

Similar past seasons

Compared on weather to 30 Oct. This season's first pick: 10 Oct.

Fruit Development Air Dryness: so far, to 30 Oct · 14,5 °C mean dew point · Fruit Development Warmth: so far, to 30 Oct · 27,2 °C mean daily maximum · Flowering-Period Sunshine: closed · 281,2 hours of sunshine · Fruit-Sizing Rainfall: so far, to 30 Oct · 62,4 mm total rain

Season	Closeness	Crop	vs its average	Picking start	Length	Fruit Development Air Dryness	Fruit Development Warmth	Flowering-Period Sunshine	Fruit-Sizing Rainfall
2018 old orchard	close (0.27)	55,1 t	+16%	-	-	14,4	27,5	286,5	96,6
2020	close (0.33)	56,3 t	-11%	14 Oct	37 d	14,4	27,6	269,9	85,2
2025	fair (0.67)	69,7 t	+10%	20 Oct	34 d	14,9	27,3	306,6	175,4
2019 old orchard	fair (0.75)	50,4 t	+6%	-	-	13,9	28,2	266,8	18,2
2023	fair (0.86)	63,8 t	+1%	14 Oct	46 d	14,7	26,7	308,6	241,5

The 5 closest seasons came in between **-11%** and **+16%** against their own record's average. That spread, not any one of them, is what the weather so far says.

"Similar seasons" in Fill uses each block's kg per tree in 2020, 2023, 2025, weighted by closeness.

How seasons are matched, and the limits

Similar past seasons: ranked by closeness of weather on the four scored factors, each with its crop against its own average, picking start and season length.

- **A range, not a number.** The model never pretends to know the crop to a kilogram. It shows a spread, and where the owner's estimate sits in it.
- **Snapshotted with each version,** so an estimate can be judged against what the weather said at the time, not only afterwards.
- **Honest about its limits.** Weather explains part of a season's swing. The similar-seasons spread is shown as the uncertainty, not hidden.

The weather record

Hourly weather for the farm's own position, one line per season ticked, any two measurements against left and right axes. Temperature, humidity, dew point, rainfall, wind, soil temperature, UV and sunshine.

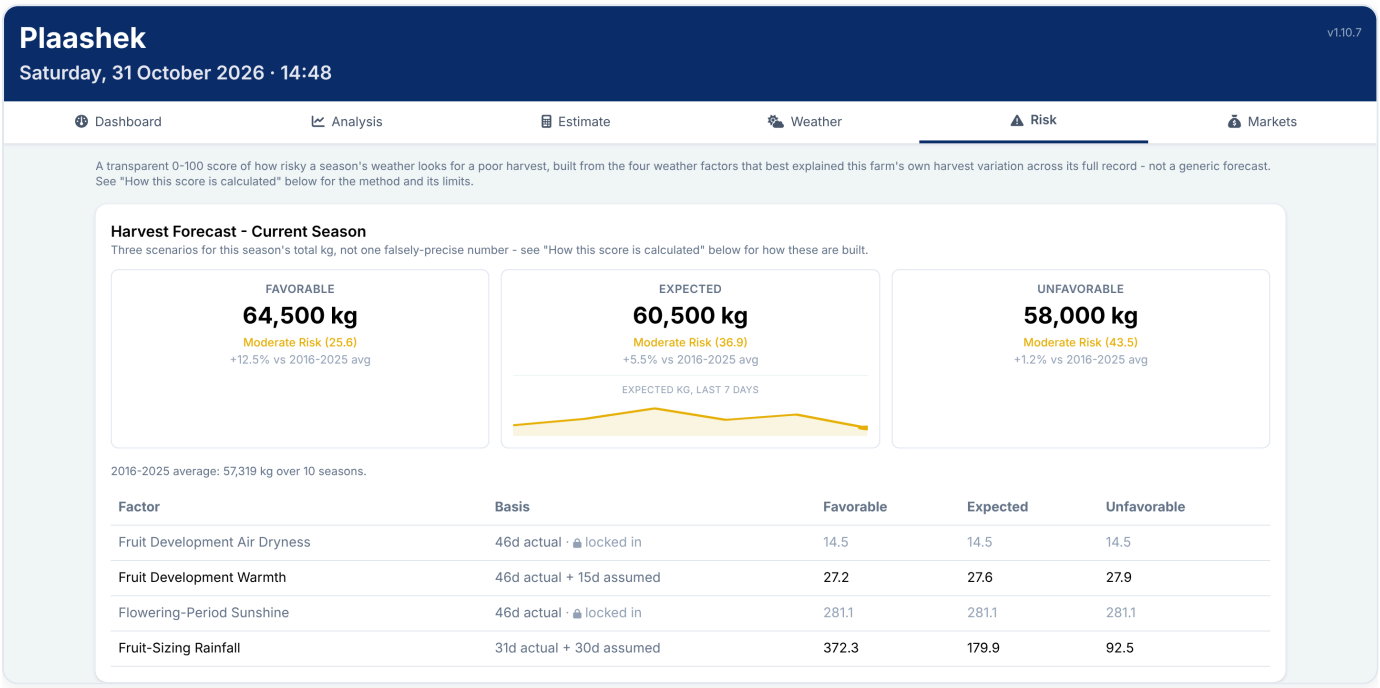

Three seasons of mean temperature and daily rainfall overlaid: the dry 2022 spring, the wet 2024 one and this season.

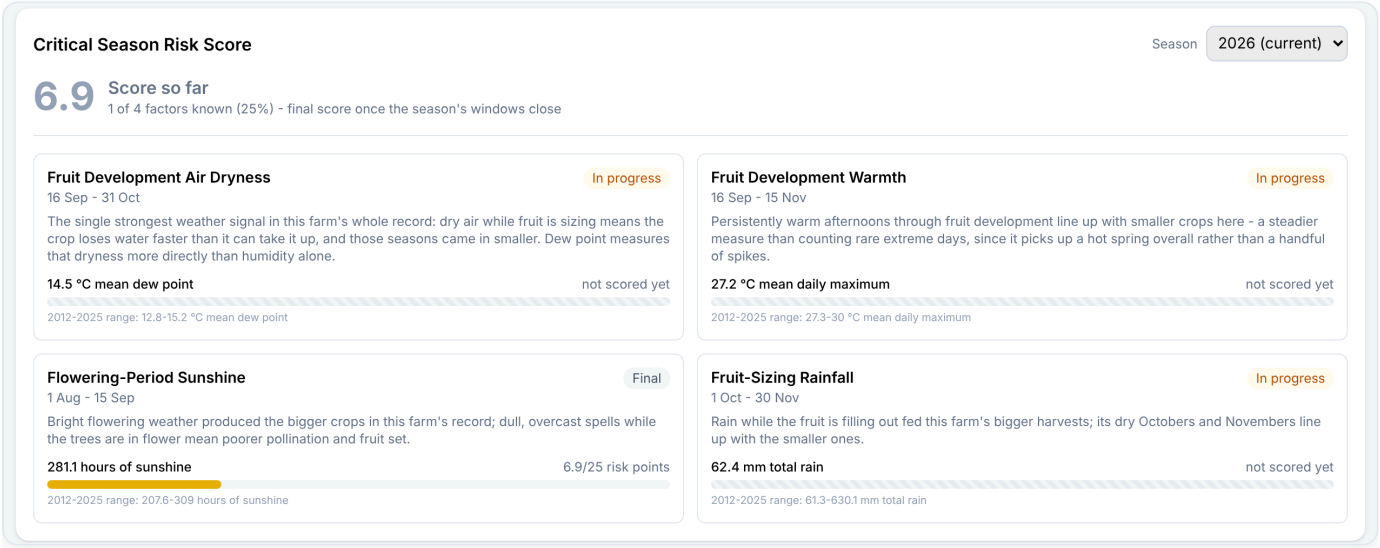

- **Kept current by itself.** Opening the tab pulls the hours since the last update and adds them to the stored record.
- **The farm's station first.** Where the farm has an on-site weather station its readings are used; the weather service fills in what the station does not measure.
- **Download any view** as a PDF for the file.

A transparent harvest-risk score

A score from 0 to 100 of how risky the season's weather looks for a poor harvest, built from the four weather factors that best explained this farm's own harvest swings across its record. Not a generic forecast: each factor shows its window, its reading and why it matters.

Harvest Forecast: favourable, expected and unfavourable kilograms for the season, with each factor's basis (days actual, forecast or assumed) and the expected figure's trend over the last week.

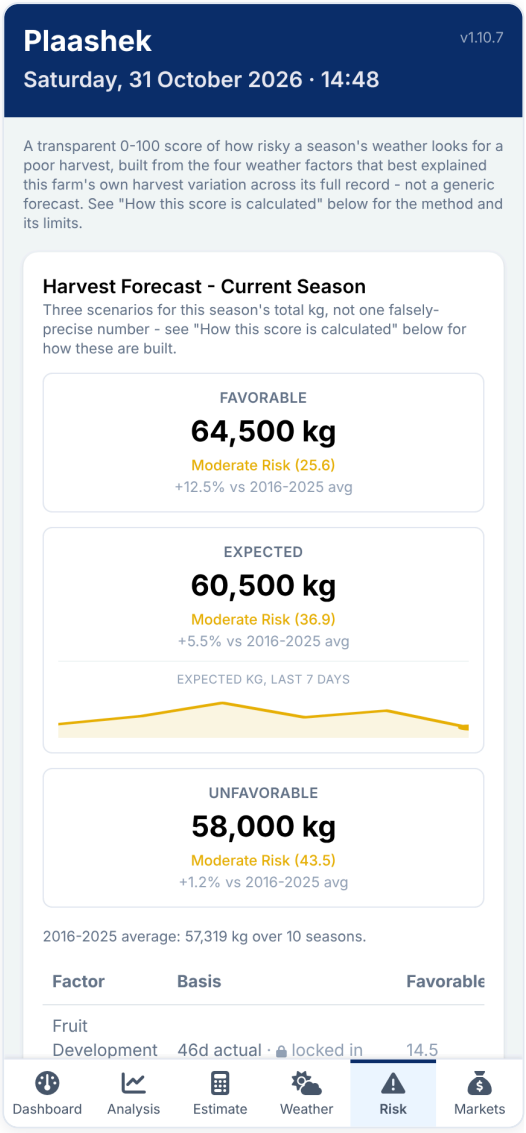

The score so far, and a card per factor: window, reading, plain-language reason and where it sits in the farm's own range.

Back-tested against every season

Risk score by season beside the actual harvest by season: a higher score should line up with a poorer crop, and the owner can see for themselves whether it does.

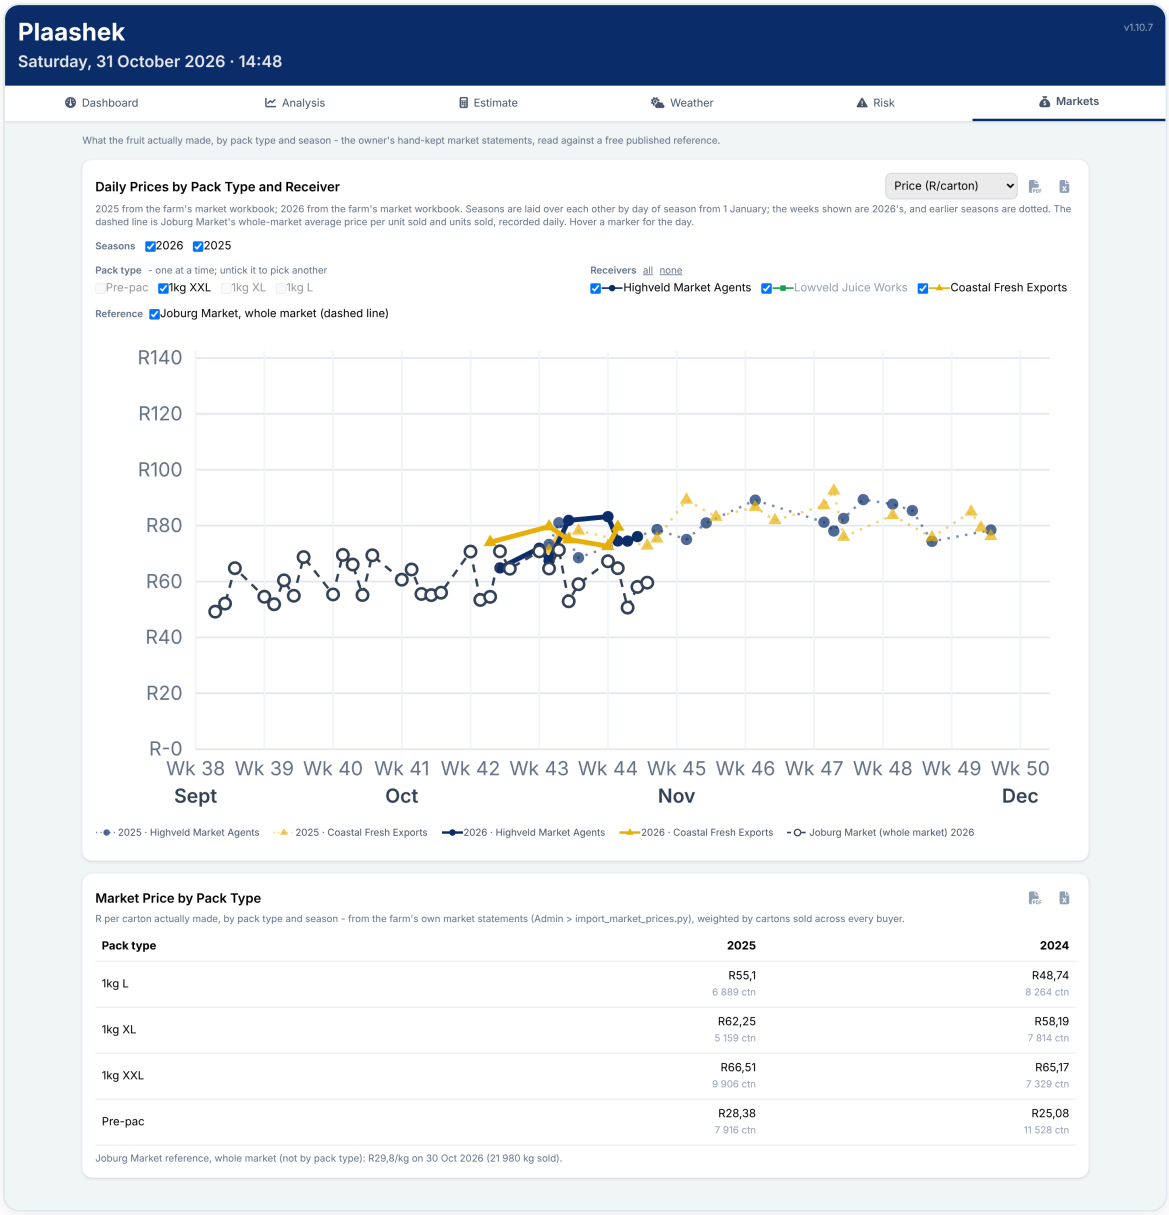

The Risk tab on a phone.

- **Four factors, fixed windows.** Air dryness and warmth while fruit develops, sunshine at flowering, rain while fruit sizes. The same calendar windows every year.
- **Open windows are projected.** A factor whose window has not closed blends actual days, the weather forecast and the farm's historical scenarios, and says how many days of each.
- **Method in the open.** "How this score is calculated" explains the study behind the factors and its limits, in the app itself.

What the fruit actually made

The owner's market statements, by pack type, buyer and day, laid over past seasons and read against a free published whole-market reference price.

Daily rand per carton by receiver for one pack type, this season solid and last season dotted, with the whole-market reference as a dashed line; below it, each pack type's season price weighted by cartons sold.

- **Season over season.** Seasons are laid over each other by week, so this year's price curve sits on last year's.
- **Reference price recorded daily,** because the public page only ever shows one day.
- **Feeds the estimate.** Last season's cartons per buyer and pack type fill the pack-out mix on the Estimate tab.

Ask AI (optional) With an AI key on the server: ask about this estimate or this weather in plain language, check an estimate block by block before saving, see what changed between two versions, a short season brief each morning, and ask the farm's notebook (Plaashek Notes). Figures are gathered first and the model is called after; nothing waits on it.

Exports	Every chart as PDF, every table and the estimate as Excel, and the whole historical record as one workbook.
Hosting and data	Your farm lives at yourfarm.plaashek.co.za on a South African hosting service, encrypted in transit and at rest, backed up daily, never shared between farms.

> Plaashek Owner is one module of the Plaashek suite. It reads Plaashek Harvest and Packhouse; Harvest's planner reads the owner's latest estimate back.

PRODUCT OVERVIEW

Plaashek

Labour: the pack-house time clock

A phone at the door scans each worker's badge in and out. Hours and overtime are worked out by themselves, missed scans are caught before payday, and the wage sheet downloads as a spreadsheet. The same badge the field tablets scan, so the register is set up once.

The door phone

Scan the badge: the screen turns green IN or red OUT with the worker's name and photo. Works offline.

Fix

Every IN without an OUT, and the other way round, listed for the admin with the reason kept on record.

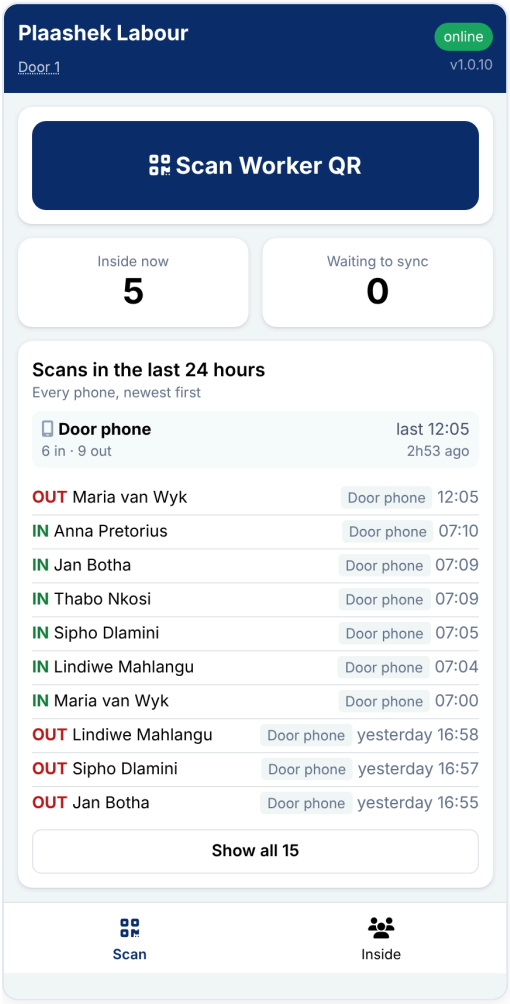

Pay

Hours, daily and weekly overtime at the farm's own rate and thresholds, per worker, as Excel.

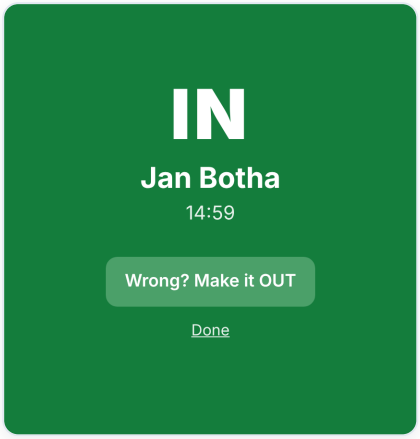

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; names and figures are invented.

Scan in, scan out

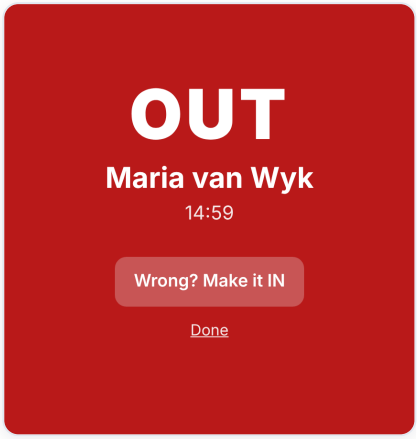

Any phone at the pack-house door. Tap Scan Worker QR, point the camera at the badge, and the screen fills with IN or OUT, the name and the time. The next worker is one tap away.

The door phone: who is inside now, scans waiting to sync, and the last 24 hours from every phone, newest first.

Green IN with a one-tap "Wrong? Make it OUT".

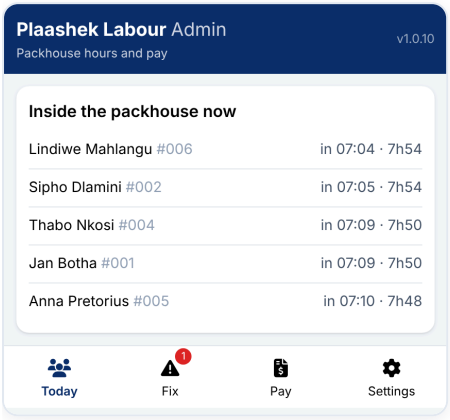

Red OUT. A badge scanned twice within a minute is refused, so a double tap cannot turn an IN into an OUT.

- **The phone decides IN or OUT** from who is inside, so a worker never has to choose. The operator can flip it while the screen is still up.
- **Works with no signal.** Scans are saved on the phone with the time they were made and sent when the connection returns. "Waiting to sync" counts them.
- **Every door phone in one list.** Each phone has a name; a phone that went quiet while the others kept scanning is easy to spot.
- **Forgot to scan out?** An OUT long after the IN is flagged on the screen, with the time of that IN, while the operator can still change it.
- **Badges from the register.** The QR badge is the one Plaashek Harvest prints; a badge that is not an active worker is refused by name.
- **No pay on the door phone.** It shows who is inside and when they came in, never hours or money.

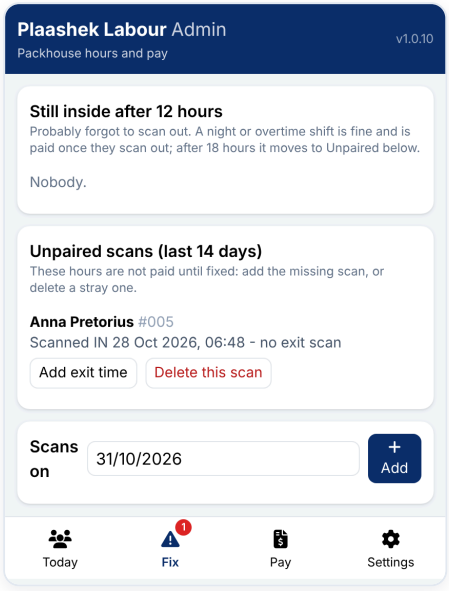

ADMIN

Who is inside, and what needs fixing

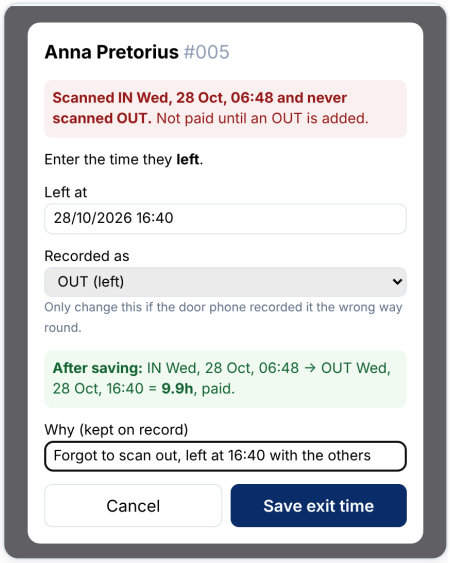

The admin page is behind a PIN, on the admin's own phone. Today shows who is in the building right now. Fix lists every scan without a partner: those hours are not paid until someone fixes them, with a reason that stays on record.

Today: inside the pack house now, with the time in and hours so far. The red badge counts scans to fix.

Fix: still inside after 12 hours, unpaired scans from the last 14 days, and any day's scans to correct.

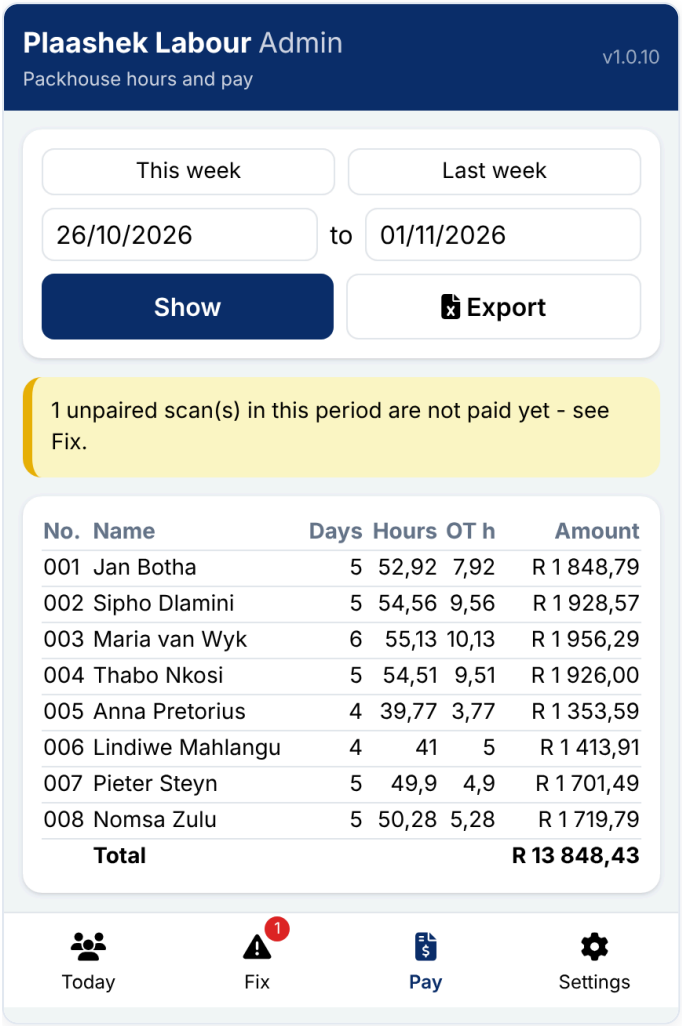

Add exit time: the form shows the shift it will make and asks why, before anything is saved.

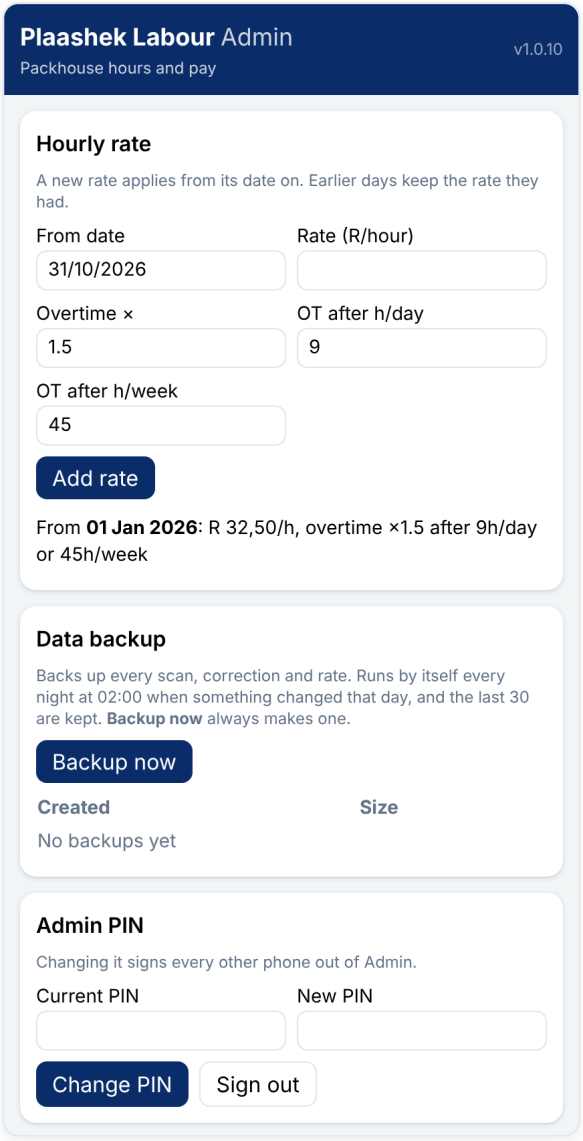

- **Nothing paid by guesswork.** An IN with no OUT, or an OUT with no IN, is an exception, not a shift. The pay report says how many are outstanding.
- **Every correction on record:** what changed, when, from which phone and why. Deleted scans are kept, marked deleted.
- **Night shifts are fine.** Up to 18 hours counts as one shift; longer is flagged as a forgotten exit.
- **No future times.** A time in the future is a wrong date, and the form says so instead of saving it.

Pay and settings

Pick this week, last week or any dates, tap Show, and every worker's days, hours, overtime hours and amount are there. Export downloads the wage sheet, the shifts behind it and the unresolved scans as three sheets of one spreadsheet.

Pay: the week per worker, with a warning when scans in the period are still unpaired.

Settings: the hourly rate with its overtime multiplier and daily and weekly thresholds, backups, and the admin PIN.

- **Overtime the BCEA way.** Hours past the daily threshold are overtime; of the rest, hours that take the Monday-to-Sunday week past the weekly threshold are overtime on the day they happen. Never double counted.
- **Rates are dated, never edited.** A new rate applies from its date; earlier days keep the rate they had, so last month's sheet never changes.
- **Whole weeks for the threshold.** A pay period that starts on a Thursday still knows about Monday's hours.
- **Nightly backups** of every scan, correction and rate, kept for 30 days, with Backup now.
- **PIN, not passwords.** The door phones need none; the admin page needs the PIN, and changing it signs every other phone out.

Devices	Any Apple or Android phone with a camera, added to the home screen like an app. One or more door phones, one admin phone.

Register	Workers, their badges and photos come from Plaashek Harvest's register, read only. Nothing is typed twice.
Hosting and data	Your farm lives at yourfarm.plaashek.co.za on a South African hosting service, encrypted in transit and at rest, backed up daily, never shared between farms.

> Plaashek Labour is one module of the Plaashek suite. It pays hourly for the pack house; Plaashek Harvest pays pickers per kilogram from the same badges.

PRODUCT OVERVIEW

Plaashek

Notes: the farm's notebook, in your pocket

What you saw in the orchard, dictated on your phone where you stand, with the block, the weather and the spot it was captured. Every note can become work on the To do list, so it doubles as a work-order book for farm staff: what to do, on which block, with what and by when. Every job ticked off becomes the block's history. Written so the next generation has the farm's knowledge.

Capture

Dictate or type, pick the block, add photos. Saved on the phone instantly, synced when there is signal.

To do

Work orders for the staff: every action a note leads to, by block, longest waiting first. Tick it off with what was actually used.

Notes

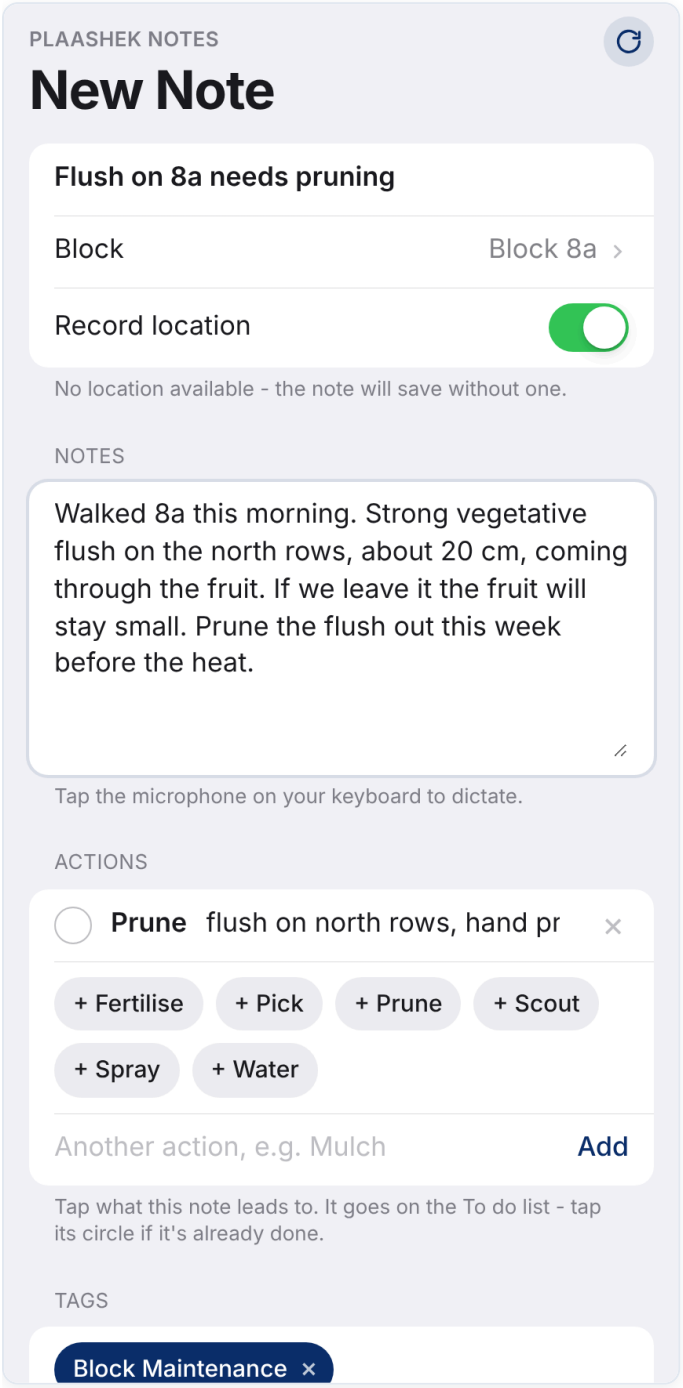

Search and filter by tag, block, variety or action: a block's whole history of spraying, feeding and pruning.

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; notes, blocks and photos are invented.

CAPTURE

Say it where you see it

A note is a title, the block or spot, the words, the actions it leads to, tags and photos. Tap the microphone on the phone's keyboard and talk; the app stamps where you stood and what the weather was.

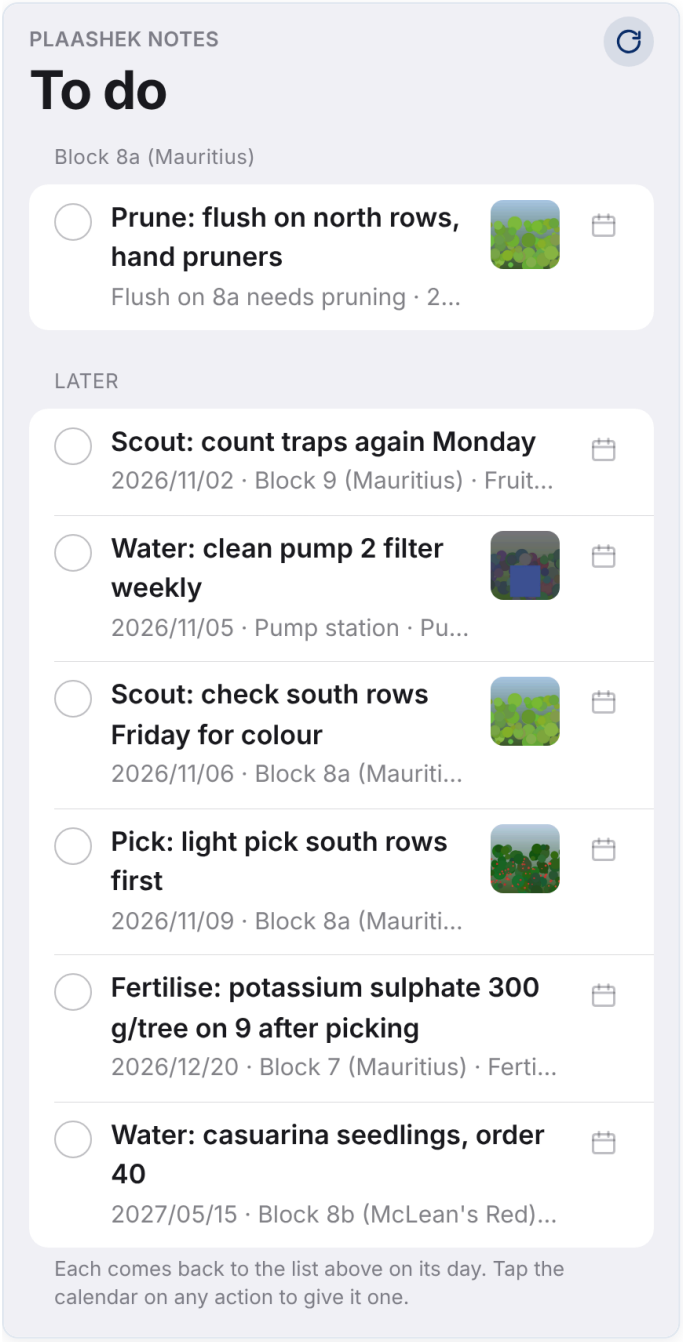

New Note: block picked from the list, the dictated text, a Prune action with what to use, and two tags.

- **Offline first.** Save Note writes to the phone at once and syncs in the background every few seconds while there is signal. No note is ever lost to a dead spot in the orchard.
- **Captured once, never changed.** Location and weather are recorded when the note is made; an edit at the house that evening does not move it.
- **Actions, not just words.** Tap Prune, Fertilise, Water, Spray, Scout or Pick, say with what, and it goes on the To do list. Tick the circle if it is already done.
- **Tags you keep adding to.** A starter set of farm tags, and any word typed becomes a new one. Spelling snaps to the existing tag.
- **Photos from the camera roll** or taken on the spot, several per note.
- **Afrikaans and English alike.** Search ignores accents and case, so "spuit" finds "Spuitprogram" and "more" finds "môre".
- **Apple or Android,** added to the home screen like an app, in the phone's own light or dark mode.

TO DO

From observation to work order to history

The To do list is the farm's work-order book. Every action still waiting, grouped by block, longest waiting first: what to do, with what, and by when. The foreman opens it on their phone, does the job, taps the circle and says what was actually used. The note then records that the block was pruned, or sprayed, on which day and with what.

To do: the open job on 8a with its photo, and the jobs parked under Later until their day.

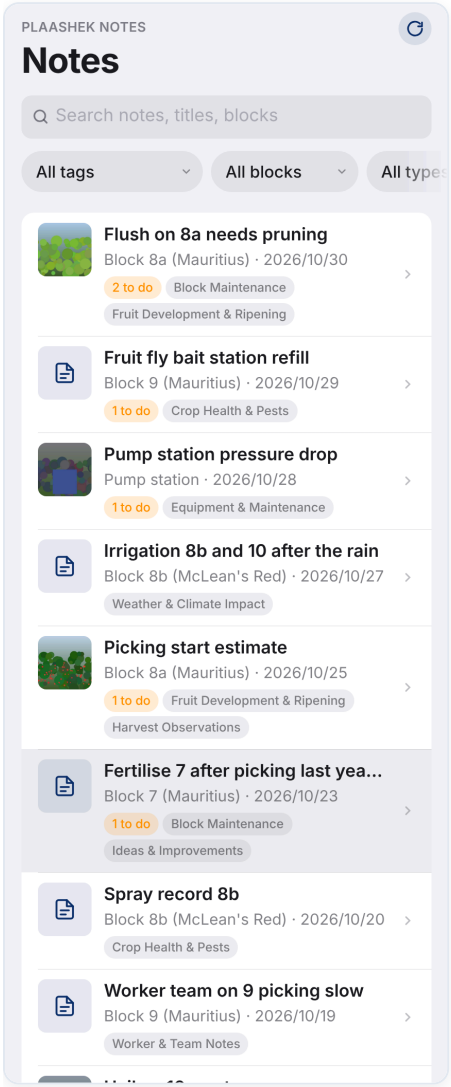

Mark as done, with a line for what was used.

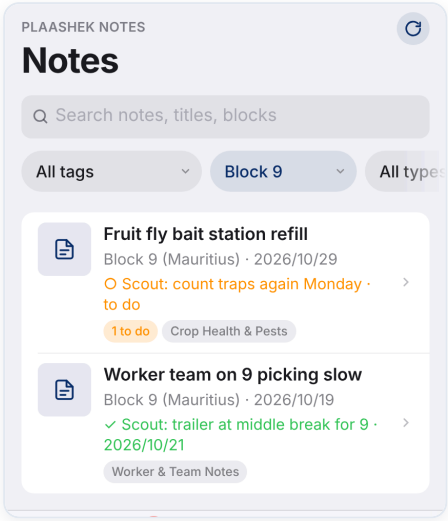

- **Work orders for staff.** A note written by the owner becomes a job the foreman or a team leader sees on their own phone, with the block, the instruction and the product and rate. No paper slip, no WhatsApp message to find again.
- **Later.** The calendar on a row gives a job a day, tomorrow, in a week or a date, and parks it until then. The tab badge counts only what is due.
- **Works with no signal.** A tick made in the orchard is dated when it was ticked, not when it synced.
- **Two phones, one notebook.** Refresh pulls in what the other phone has added.

Find it again

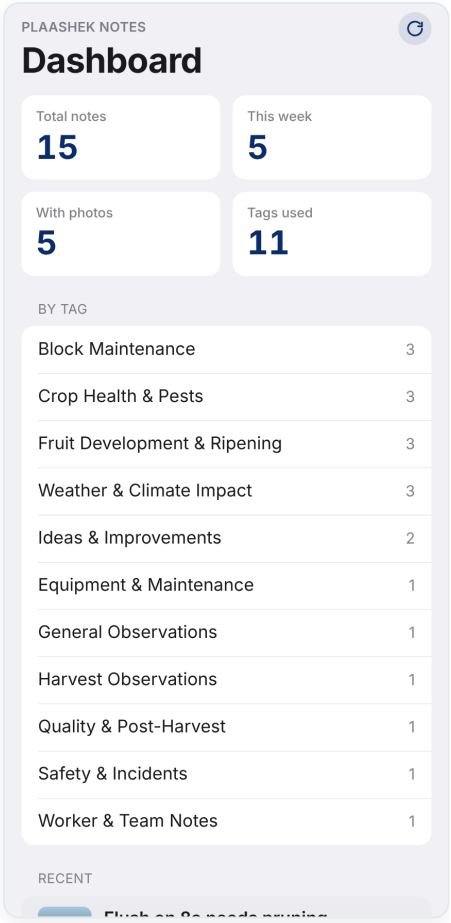

Search by title, text or block, and filter by tag, block, variety or action. Choose a block and an action together and you have that block's history: every spraying of 8b, when, and with what.

Notes, newest first, each with its photo, block, date, open actions and tags.

Block 9 filtered: each note shows how its action stands, to do in amber, done in green with the date.

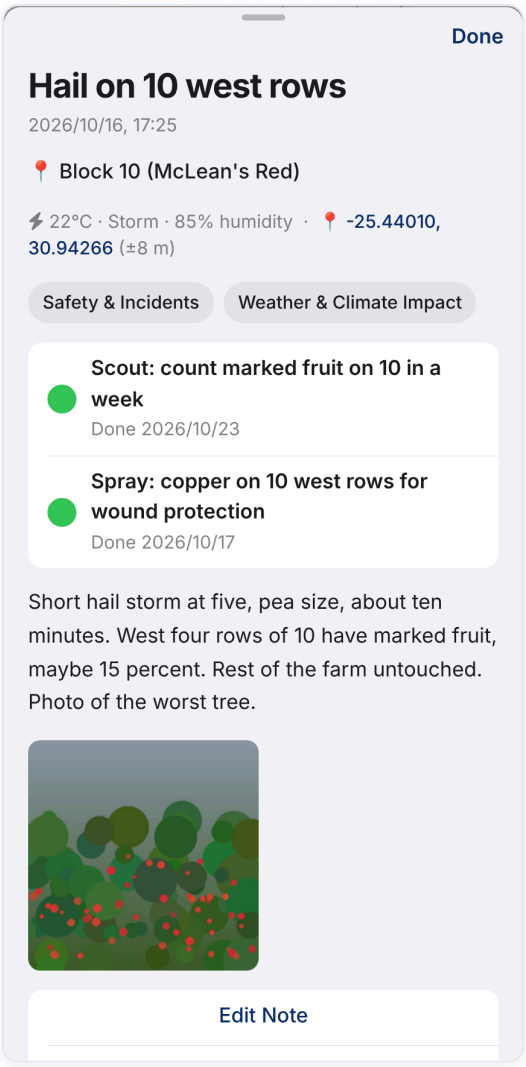

Dashboard: totals, notes per tag, and the most recent notes.

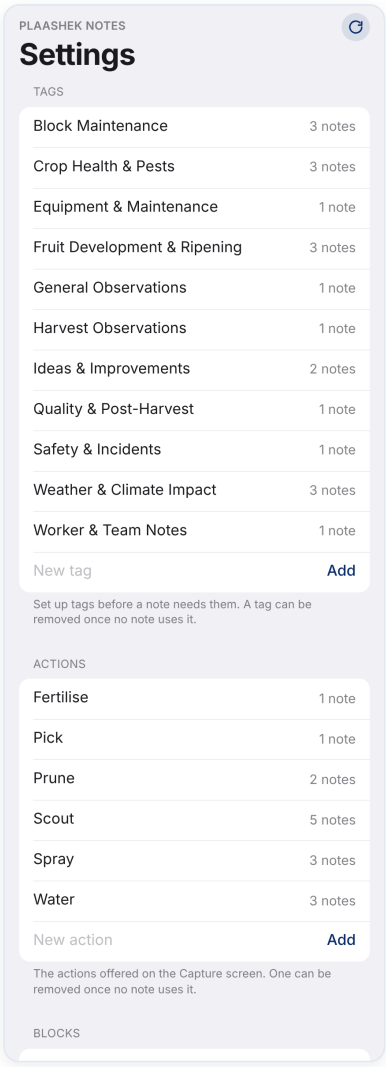

- **Fifty at a time.** The list loads as it is scrolled, however many seasons are in the book.
- **Archive, never delete.** An archived note disappears from every list but is kept, and Restore puts it back as it was.

A NOTE IN FULL, AND SETTINGS

Everything a note knows

A note opened: date and time, block and variety, the weather and the spot it was captured (tap for the map), tags, its actions with when each was done, the text and photos.

Settings: tags, actions and blocks with their variety, each showing how many notes use it; sync and backups below.

- **Blocks with a variety.** Set up once; the Capture screen groups them by type, and Notes can filter by either.
- **Optional AI help.** With a key on the server, AI Tidy up punctuates a dictated note, suggests tags and the actions it implies, and Ask AI answers questions from the notebook alone. Without a key, everything else works.
- **Backups every night,** database and photos, with Back Up Now.
- **No audio stored.** Dictation is the phone's own; only the words reach the app.

Who it is for	The owner and whoever will run the farm after them, and the staff who carry out the work orders on the To do list. A phone each, one notebook, no sign-in.
Hosting and data	Your farm lives at yourfarm.plaashek.co.za on a South African hosting service, encrypted in transit and at rest, backed up daily, never shared between farms.

> Plaashek Notes is one module of the Plaashek suite. Plaashek Owner's "Ask the farm notes" reads it, so a question about a block can draw on what was written in the orchard.

PRODUCT OVERVIEW

Plaashek

Kudde: the herd book on a phone

Every animal and everything that happens to it: born, weighed, treated, moved, sold or died. Recorded at the kraal on a phone that works with no signal, so the office always knows where the herd is, what it weighs, and which animals may not be sold yet. Built for cattle, and adjusted for sheep, goats, pigs or any other livestock you keep.

Field

The herd camp by camp. Tap an animal, record the event, done. Weigh and treat sessions run the whole crush in one go.

Admin

The office: herd counts by class and camp, who needs weighing, who is in withdrawal, the full editable herd list.

Any livestock

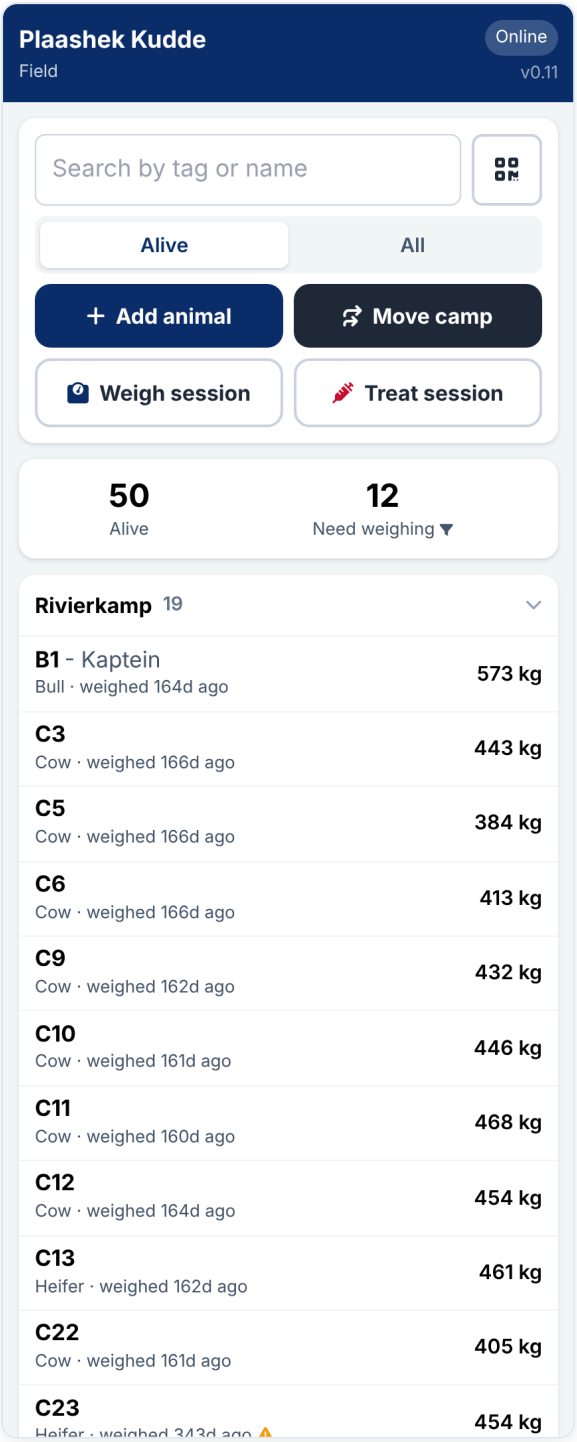

Cattle today. Sheep, goats, pigs and other animals follow the same records, with the farm's own class names and rules. Speak to Plaashek about your situation.

Hosted in South Africa at yourfarm.plaashek.co.za. All screens in this document show demonstration data; the herd and its camps are invented.

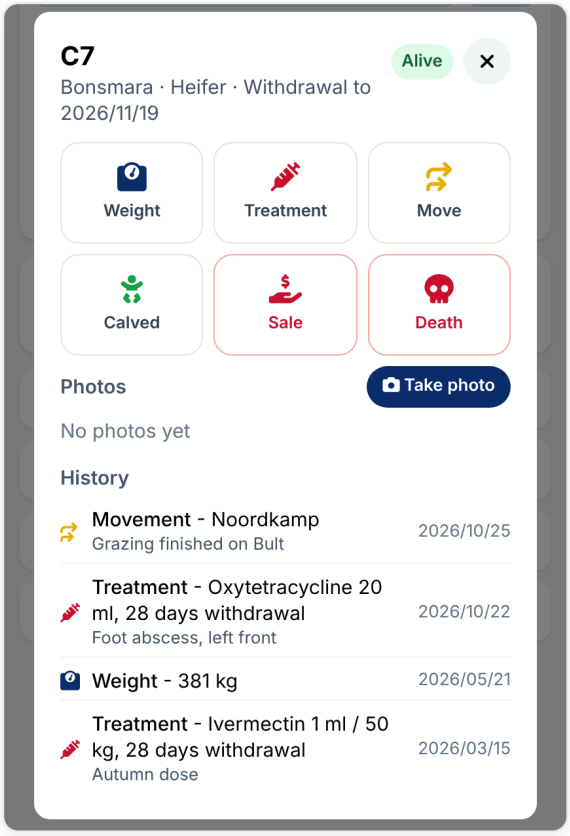

FIELD

The herd, camp by camp

The field app is for whoever is out with the cattle. The herd is listed by camp in the farm's own order, each row with the animal's class, when it was last weighed, and its weight. Search by tag or name, or scan the tag.

The herd: alive count, animals needing weighing, and a camp opened to its animals. A warning triangle marks an animal overdue a weighing.

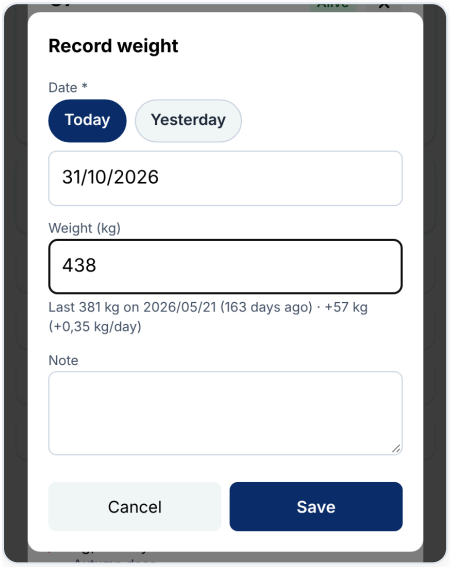

An animal: breed, class and withdrawal at the top, six event buttons, photos and the full history.

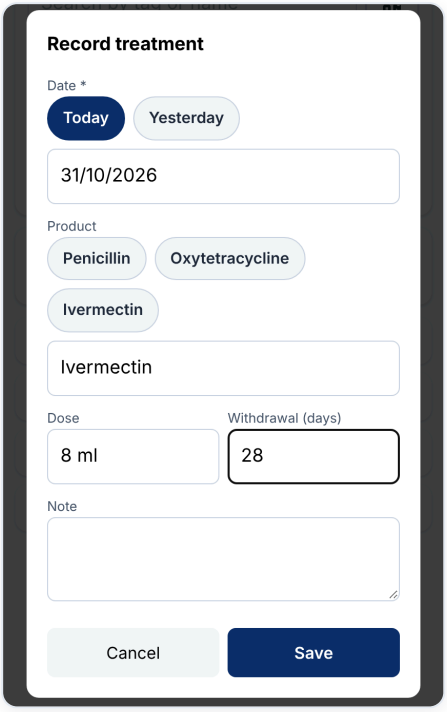

- **Works with no signal.** Every record is saved on the phone first and sent when the server is reachable. Counts are worked out on the phone, so they are right the moment something is recorded.
- **Six events.** Birth, weight, treatment, movement, sale and death. A death or sale sets the animal's status; there is no separate field to forget.
- **Class is derived.** Cow, heifer, bull, steer or calf comes from sex, birth date, the castrated flag and whether she has calved.
- **Need weighing is a worklist.** Tap the count and the list becomes only the animals overdue, by camp.

Recording an event

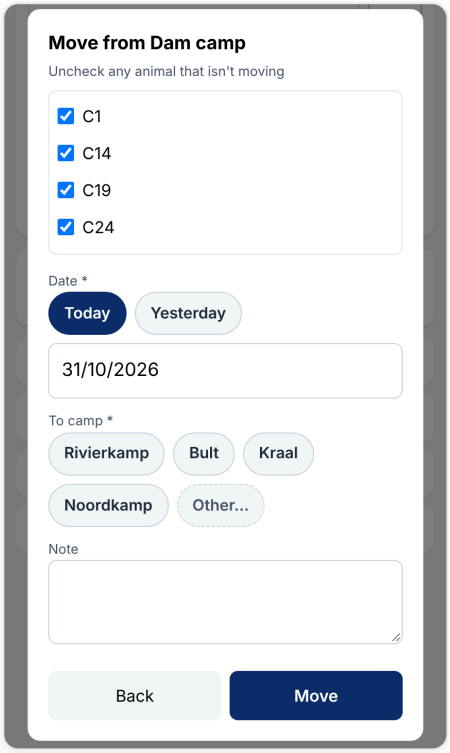

Today or yesterday with one tap, or any past date. A weight shows the last one and the daily gain. A treatment remembers the farm's products and sets the withdrawal period, so the animal is flagged until the day it may be sold.

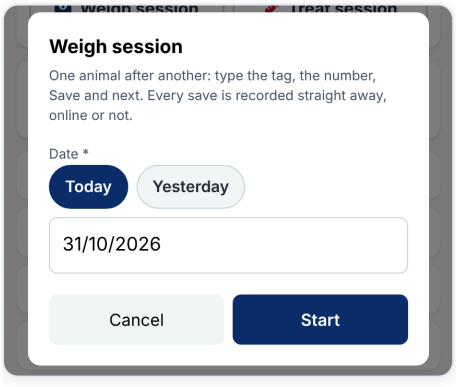

Record weight: the last weight, days since, the gain and kg per day as you type.

Record treatment: product chips from what the farm has used before, dose and withdrawal days.

Move camp: the whole camp ticked, untick the ones staying, pick the camp they go to.

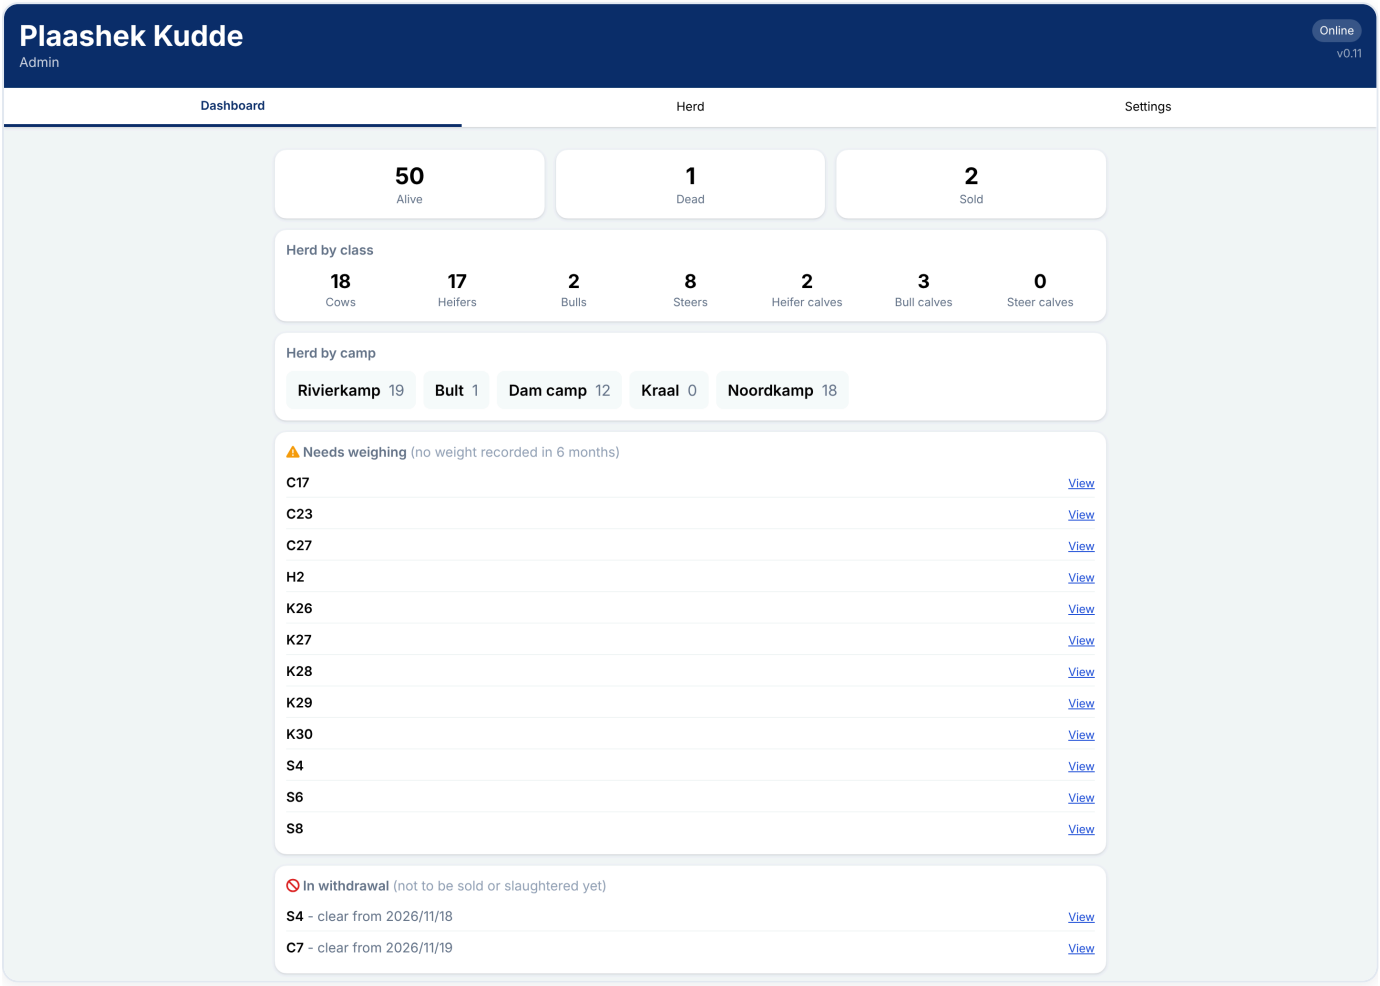

Weigh session: tag, number, save and next, animal after animal.

- **Sessions for the crush.** A weigh or treat session takes one animal after another: type or scan the tag, the number, Save and next. A treat session applies the same product and dose to each.
- **Calvings in one step.** Calved on a cow records the birth and creates the calf with its dam and sire, in the cow's camp.
- **Weather for free.** With the farm's position set, each event is stamped with that day's temperature and rain, for looking back later.
- **Camps snap to spelling.** A camp typed at the gate matches the office's spelling, capitals or not; an unknown one is added rather than refused.

ADMIN

The office view

The dashboard counts the live herd by class and by camp, lists every animal overdue a weighing and every one still in withdrawal, and shows the latest events from every phone.

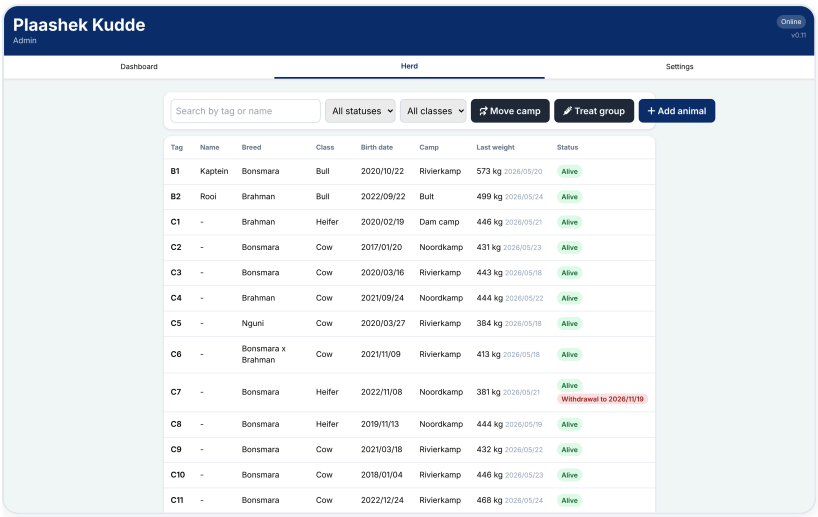

Dashboard: alive, dead and sold; cows, heifers, bulls, steers and calves; herd by camp; needs weighing; in withdrawal with the first day each may be sold.

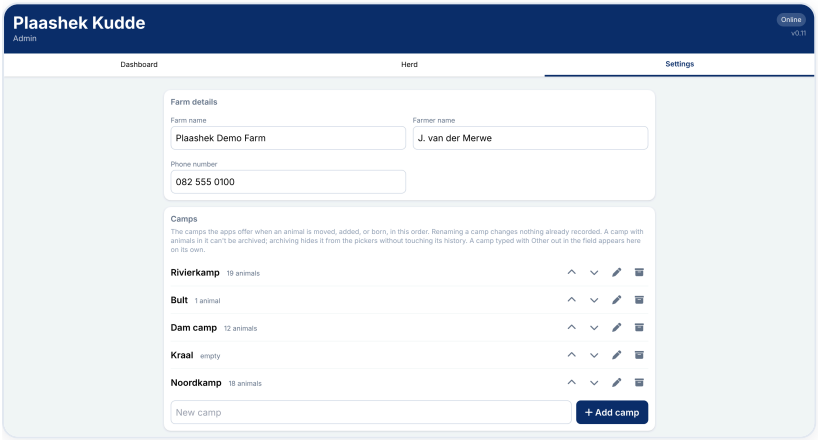

- **Withdrawal is never missed.** Any animal inside a treatment's withdrawal is listed with the date it clears, and flagged in red on the herd list.
- **Six months without a weight** puts an animal on the needs-weighing list, with a link straight to its record.

ADMIN

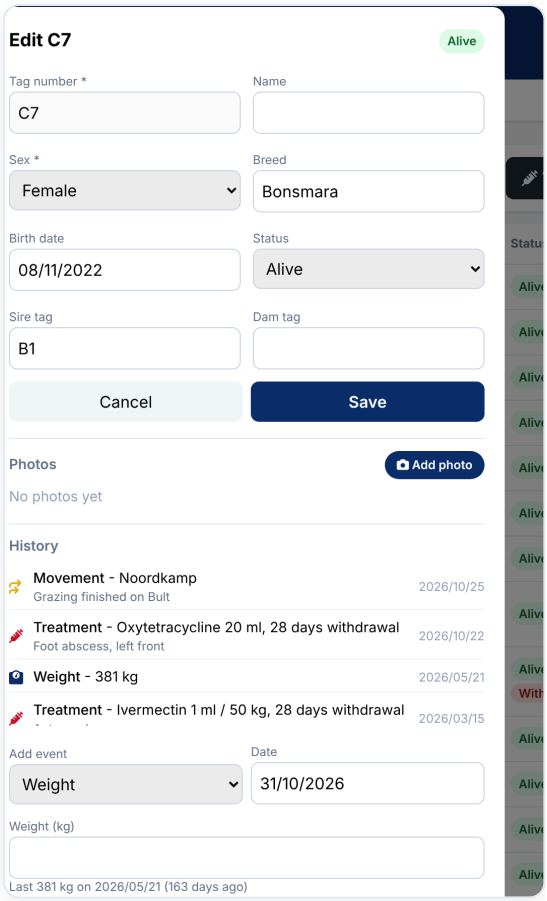

Herd, records and settings

Herd: the full list with breed, class, birth date, camp, last weight and status, filtered by status and class. Move camp and Treat group for the office.

Settings: farm details, the camps in the order the phones offer them, the farm's position for the weather, and CSV exports.

An animal's record in the office: identity, parents, photos, history and a form to add an event.

- **Export for the accountant or the vet.** The herd and every event as spreadsheets.
- **Parents need not be on file.** A bought-in animal or a borrowed bull can still be a sire or dam.
- **Not only cattle.** Kudde is adjusted for sheep, goats, pigs and other livestock: the classes (ewe, ram, lamb; sow, boar, piglet), weigh intervals, gestation and litters are the farm's own settings. Speak to Plaashek about your situation.

Other animals	Sheep, goats, pigs, game or any other livestock: Kudde is set up for your animals with their own class names and rules. Speak to Plaashek about your situation.
Devices	Any Apple or Android phone for the field, a PC or phone for the office. Nothing to install from an app store.
Hosting and data	Your farm lives at yourfarm.plaashek.co.za on a South African hosting service, encrypted in transit and at rest, backed up daily, never shared between farms.

> Plaashek Kudde is one module of the Plaashek suite. It stands on its own, with the same badge-free, offline-first design as the orchard modules.

THE REST OF THE SUITE

Other Plaashek modules

The modules in this document are the ones built and running on a working farm today. Plaashek is sold as modules per farm, all working on one set of the farm's records, so each of the modules below reads what the others already hold rather than asking for it again. Two are free and always on.

Weer

Free, always on

Weather

The forecast for the farm's own position, now and the next 16 days; the rain record for the last day, week, month and the season against every year since 1940; frost nights highlighted; any year against any other on one chart. Its daily weather record is what the other modules stamp their captures with.

Eienaar

Free, always on

Owner

The first module a farm has after setup: a summary of what is happening on the farm, drawn from whichever modules are in use, with a "needs attention" list (a withdrawal ending, a weighing due, a frost night forecast) and optional AI analytics in plain language.

Werkers

Module

Workers and labour

The full worker register: identity, employment, bank and tax details, encrypted. Time and attendance per team (the Labour time clock in this document lives here), contractor crews and rates, payroll and wage runs with payslips, PAYE and UIF, bank and cash lists. Harvest's piece-rate pay flows into it.

Veldnotas

Module

Field notes

The Notes module in this document, in the suite: farm information captured anywhere as photo, voice or text, kept searchable, with work orders for staff and AI trend analysis across seasons.

Stoor

Module

Input stores

Chemical and fertiliser stock on hand, issues per block, linked to the spray programme, with expiry dates and safety data sheets. The office knows what is on the shelf without walking out to count it, and where it went.

Water

Module

Irrigation and boreholes

Borehole, meter and level readings, pump hours and scheduling, water use per block and per season. The latest reading per point and how much moved since the last visit, without a paper logbook in a bakkie.

Bespuitings

Module

Spray records

Spray and fertigation records per block, product and operator, with the withholding period and safe-harvest date worked out, booked against Stoor's stock and Water's readings. The paper compliance book, kept by the phone.

Werkswinkel

Module

Implements and vehicles

Service schedules and job cards for every tractor, pump and bakkie, breakdown and repair history, diesel and hours per machine.

Oudit

Module

Compliance

GlobalG.A.P., SIZA and buyer audit evidence assembled from Harvest, Kudde and Stoor records, with gaps flagged before audit week.

Your module

Any crop, any process

Built for your farm

A process the suite does not cover yet, from grading to cold store to a weigh sheet of your own, is added as a screen with the same badge sign-in, offline capture and reports. Speak to Plaashek about your situation.

> Each module is switched on per farm and charged monthly. Weer and Eienaar are free and are never switched off. Hosting is per farm, in South Africa, at yourfarm.plaashek.co.za.

NEXT STEP

Speak to Plaashek

Tell us which crop you pick, how big the pack house is and which of the modules you would start with. Setup is remote: your farm's address is created, your blocks, camps and workers loaded, and your people trained over a call.

WHATSAPP	EMAIL	WEB
083 456 5646	**info@plaashek.co.za**	**www.plaashek.co.za**

What you get

Your farm's address	yourfarm.plaashek.co.za, its own installation and its own database, never shared with another farm.
Hosting	A South African hosting service. Data encrypted in transit and at rest, backed up every day. Nothing to install or look after on a farm PC.
Devices	Any Apple or Android phone or tablet, added to the home screen like an app. For the picking stations we recommend the rugged Ulefone RugKing 3 Pro or 4 Pro.
Modules	Switched on per farm, charged monthly, added or removed by a message. Weer and Eienaar are free and always on.
Your data	Stays yours. Every module exports to Excel, and the farm's records are handed over if you ever leave.
Support	Over WhatsApp, from the people who built it and run it on a farm.

References

1. Plaashek module overviews, one per module, from which this document is assembled: Harvest, Packhouse, Owner, Labour, Notes and Kudde. Each is available on its own from Plaashek.
2. Plaashek service agreement, Schedule A: the module list and descriptions used on the "Other Plaashek modules" page.
3. Ulefone RugKing 3 Pro and RugKing 4 Pro specifications, as published by the manufacturer and listed by GSMArena at the time of writing (October 2026). Check the current model before buying.
4. Weather data in the Owner and Weer modules: Open-Meteo (open-meteo.com), with the farm's own weather station where it has one. Only the farm's position is sent.
5. Market reference price in the Owner module: the Johannesburg Fresh Produce Market's published daily prices.
6. Overtime rules in the Labour module follow the Basic Conditions of Employment Act pattern; the farm sets its own rate and thresholds.
7. Export paperwork in the Packhouse module follows the DALRRD phytosanitary accompanying document, the consignment note and the PPECB litchi inspection findings sheet.

Every screen in this document shows demonstration data. Names, blocks, animals, weather, prices and figures are invented; no real farm's records appear. Plaashek, 2026.
